Thanks Luc, that's useful data, so it looks like my planned power level is ok if I have an antenna with about 18dbi gain

I see it's linear polarisation - do you have fading problems or is that not such an issue on L and S?

None that i can detect who is affecting too much when the downlink is on UHF but with low power i often have half of a pass good and the
other half very week probably due to the antenna pointing. I say probably as i used to have a QSO where the station was barely above noise
from AOS to TCA when i was able to hear my own downlink S9 but on the TCA to LOS my signal goes back near the noise level and some time too
weak to be heard when the other station was S9

2846. Morse transmission

Yahoo group: eu-amsat
Date: 2009-10-11 22:35:08 UTC
From: Thomas Frey
Topic: 2846 Message: 2846

Hello All and morse afficionados

I heard the new turkish CubeSat ITUpSAT1 with its morse transmission.
I heard it was NOT in CW. I could hear the morse code in USB and FM.
I think, it was keyed and modulated FM. Is there a description for this
mode ? If I remember me right, John was talking about it a few time
ago.

Hello Thomas,

if you had an SDR receiver it would have been easy to identify the
emission :-)

They send an FSK signal. The modulation is quite strange, the silence
is done sending a mark frequency, the tone is obtained switching
between mark an space.
The result is a kind of FM with the carrier on one side. If you like
I will send you a spectrogram later.

Just an excerpt from the amsat-dl AO-40 status page
http://www.amsat-dl.org/journal/adlj-p3d.htm

"The BCR's are designed to function with the solar panels extended, when they have to handle over 3 times the power available in spin
mode."

You can also have a pretty good idea of AO-40 life at http://en.wikipedia.org/wiki/AO-40.

Is AO-40 will be a next AO-07 in 30 years from 2004 lets say in 2034? just reading back this catastrophic event period i note this.

" --W4SM for the AO-40 Command Team

PERSONAL NOTE : Like my colleagues on the command team, I have lived and breathed AO-40 for over four years. All of us can almost mentally

decode 400 bps PSK. We hear it in our sleep. I was watching the battery voltage telemetry at the exact moment that the voltage dropped
precipitously. In my "day job" I have frequently watched catastrophic events unfold in human beings, and the feeling was EXACTLY the same.
Part of my day job is to have to make quick decisions during times such times, decisions that can have serious consequences. I was
instantly aware that we had a serious power event, and I considered cutting the main battery loose and trying to run on the nearly
completely discharged and untested under load aux. battery. However, because I did not have a clear understanding of where the primary
fault was, I elected to watch things and try to figure out what was happening. The general rule of, "when in doubt wait to understand"
works most of the time... In this case it didn't, and I'd sure like to live those minutes over again and cut the main battery loose.
Hindsight is always 20-20. Of course, if it had crashed anyway, then I'd really be beating myself up. If it's at all possible to bring AO-
40 back, we will. If the voltage is clamped low and there is no other damage, we may end up waiting a long time for a cell to "open",
hopefully not as long as for AO-07. ..or it may happen today. No success for even weeks or months does not mean that we won't eventually be
successful. We will sure keep trying. Several of you have written very nice notes of support. Thank you."

I have a question in mind since that time. Is an open cell event as the one happens in AO-07 can in the last AO-40 batteries context and
condition enable enough power/voltage-current to bring the satellite to some sort of life?

Hello Marco

This is very interesting and we can learn something about a CubeSat. :-)
I have no SDR-receiver, just an old IC-R7000.

Hmmm... If I can hear the morse-tones in FM then it is AFSK (not to
confuse with Packet Radio, it means AudioFrequencyShiftKeying). But the
carrier is keyed and not steadily as an FM-transmission is normally.
Please send me your spectrogram or you can upload it for the group, Thanks.

The CubeSat Kagayaki was also forseen to send morse-code in FM, but it
is silent.

I think NO. I understand the hope to bring AO-40 back to life. Be realistic. There was an explosion with high toxic fuel inside the satellite. Electronic was destroyed. I dosen't believe for wonders. It's not realistic to compare AO-7 with AO-40.

Well, I just uploaded a spectrogram of ITUpSAT (saturday's pass).
Time runs from bottom to up.
If you look at the sidebands, from top you read "TA1..." etc
When there is no modulation then the carrier is at the left of the
channel center.
IMHO it is an FSK (not AFSK), done by modulating an FSK modem with a
constant 0 for silence and a bit-reversal, 1 kHz sequence for tone.
At end of message the carrier is switched off, and there is a
different tone (2 kHz). Delta-f is 5 kHz.

19+19 Tonna, an old Microwave Modules converter, Perseus, Winrad 1.32.

2853. G-5500 Rotator off heading on the control box

Yahoo group: eu-amsat
Date: 2009-10-12 12:17:30 UTC
From: kp4ed_1
Topic: 2853 Message: 2853

Dear Friends:

Following please find copy of the email forwarded by me to Yaesu on the subject malfuction. I will appreciate comments on this if someone of you had the same trouble.

Dear Sirs:

Please provide me support to correct the follwing malfunction of my az/el rotator Model G-5500 purchased about 5 months ago to AES in Orlando, FL.

The rotator moves correctly when the control is set to 0, 90, and 180 deg but from this heading upwards up to 360deg it gets off course, contrary to the heading indicated on the control box.

I have checked the 6 wire cable connections at both ends and they are correct.

Your support will be appreciated very much.

Sincerily,

Luis, KP4ED

2854. CW and FM

Yahoo group: eu-amsat
Date: 2009-10-12 16:11:17 UTC
From: John Hackett
Topic: 2854 Message: 2854

Hello Thomas,
You're quite right, I have mentioned CW and FM modulation twice in the last 12 months but was flamed both times ... so I decided to shut up! ... he he he.

Basically, it was about the following.

The self-proclaimed 'experts' are always saying we should encourage the FM crowd to 'upgrade' to CW and SSB - but that's rather difficult with a lack of linear transponders.

Many years ago, people used to use MCW (modulated CW on FM) by keying the PTT of their HT's (handie-Talkie aka handheld FM rigs.) It worked extreemly well on AO-27 in the 90's.

The trick was to keep the power down.

The Indian command stations of VO-52 suggested that newcomers without SSB rigs use this method on VO-52, the modern 'experts' (predominantly American) disagreed and frown upon any use of CW on FM.

Personally, I think it could go a *LONG* way to getting rid of the *ZOO* mentality on the FM satellites if it was done sensibly ... that is to say ... a *CLEAN* stable oscillator signal fed to the microphone input at a *LOW* power ... but of course, you can bet your rotor some Alligator would still !!!! call CQ over the top of you ...

Full duplex? ... Oh yes ! sir ... he he he.

It would require a revision of the current standard of operating proceedure ... which was a *LOT* higher when people took exams to get a license. Nowadays, they give licenses away FREE with 3 x packets of Corn Flakes at your local supermarket.

KIDDING ... but there is no question that the standard of operating was a *LOT higher before the 'free' licenses came along.

Here our ham licence certification has been revamped...there is an unique 1000 multiple choice question bank 100 per 10 section. The exams
are built taking 10 question from theses 10 section that's make 100 questions exams questionnaire You should have 70% the get your first
license and if you get 85% you are granted the full ham privileges HF-and vhf and up.

What it take's is a very good memory and the patience to go through the 1000 questions bank. If you note i never speak about CW there is
some sub combination with CW but i don't even care to read them...Who cares anyway with this system?

Hi Luc,
You said ...

>If you note i never speak about CW there is some
>sub combination with CW but i don't even care to
>read them...Who cares anyway with this system?

Well ... I do - and I suspect, as do most people who took the trouble to learn CW.

The following is my personal opinion.

When the going gets really rough, particfularly interference-wise ... CW is probably *THE* most reliaqble mode due to it's simplicity. Of course, PSK31 is also a very good weak signal mode - but you need a computer.

Competent CW operators can COMMUNICATE by simply banging on a wall with a brick.

As the Jay Leno 'You Tube' videos show, a couple of old timers on CW leave a couple of young people on SMS way behind, speed wise.

I would aski the anti-CW people to ponder this ... there *IS* a reason most satellites have a *CW* beacon ... and it's not! nostalgia.

Having said that ... I for one agree that it should not be mandatory ... but opertating proceedure should !!!.

I reiterate ... the above is my personal opinion - (to which I'm entitled). I do *NOT* ask anyone to either agree or disagree.

Could I throw my 2 penceworth on the fire?

I'm a member of the Elderslie ARS (Renfrewshire) and we are an approved exam test centre. I have marked quite a few exam papers and I see problems on all sides.

One foundation paper I marked fairly recently asked what units frequency is meaured in. The answers to the question, (4 of the multiple-choice sort) included both Hz and Cp/s. I was shocked and astounded at that!
It seems that Cp/s is the wrong answer, because Hz is the 'accepted' book answer, if you like, 'book approved'. (sound familiar?)

I'd also like to point out that some of my radios are clearly marked in Mc/s and Cp/s.... so I imagine they also must clearly also be 'wrong'. Utterly disgraceful practice IMHO, on the part of the exam system / question pool. Yes, I did complain about it (weeks ago) in the strongest possible terms, but as yet... no feedback. I don't really expect any to be honest.

In the UK, there are foundation, Intermediate and advanced classes. My own personal opinion is that both Foundation and Intermediate are too dilute to be of real use to the candidates while offering far more generaous operating priviledges than they actually need, while Advanced is just right, same as the old 'Class A or B).
This leaves a large gulf between the Intermediate and Advanced exams so I suspect that many people don't ever progress beyond the Intermediate stage. Foundation gives access to most things with a 10W limit. Intermediate raises the power limit to 50W. I was asked recently to repair a 200W solid-state 2m Linear amplifier for an Intermediate licensee. Go figure, as our US cousins like to say.

A look around our club turns up many Foundation licensees, a couple of Intermediates and a few Advanced (mostly old style full licenses).

The Foundation exam requires the candidate to answer 25 questions. To get a pass, you only require to correctly answer 18 questions. This, along with some limited hands-on stuff, gets you access to most of the amateur bands you'd want with a (non-enforced) 10W power limnit. Sorry, but I think the exam system was far better in the past. The 2M and 70Cms bands around here sound at times like CB. Operating standards vary from excellent to downright non-existent. Almost always, the bad operating is by M3's.

The system as it stands is failing newcomers to amateur radio IMHO. It NEEDS to be a lot better. It's not all negative though, the new license structure has some hands-on stuff which I applaud. Thats a definite improvement over the exam based, 'drop em straight in it' systems.

Falls off soapbox!

I found the modulation you describes in Wikipedia. ITUpSAT1 transmits
a FSK beacon in "FSK-CW" designated as F1A. See
http://en.wikipedia.org/wiki/Letter_beacon#FSK_beacons

Also interesting is http://de.wikipedia.org/wiki/Modulationsart

Must be a return to the 1930's. Then there were no written exams in the UK you just asked for and paid your money to get a licence.

I'm glad to say there are some Amateurs from that era who are still active on the bands and superb operators they are despite the absence of any formal written exam.

Re exam questions it's what appears in the syllabus that matters nothing else. c/s aren't in the syllabus, hence the reason for it being the wrong answer.

If you think about it there is little point in teaching archaic units used in the early 1900's. Granted it's an interesting bit of history but not really relevant to Radio Communications in the 21st century.

BTW there's been several questions that I've marked where I've initially thought that there could be another "right" answer in addition to the one given. However, in each case it turns out that knowing too much about a subject can make you see reasons why a different choice might be true. The key thing to remember is the exam is on the Radio Communications Syllabus and nothing else.

When i wrote " If you note i never speak about CW there is some sub combination with CW but i don't even care to read them...Who cares"
anyway with this system?

Just to pointed out the meaning of the "system" it is this new no code licence where even if we feel they still should have kept the CW
requirements they decide to let it go with the natural conclusion now that "Who cares" now as we don't need it to get an amateur radio
licence.

I agree with you a CW signal can be detected where a phone signal will not but in this first part of the 21st century we have PSK 31 where
many DB'S below the noise level a PSK 31 signal can be decoded where a CW signal cannot be detected.

Many folks are refusing to let a message on a voice mail system it's their choice but even if CW win the Jay Leno contest they will have
hard time in the context of the 2009 Montreal Black and Blue event and the participants will surely prefer their IPhone Blackberry and so
on to send their text/audio/video message live while dancing they will probably having some rough time with their CW key...

Have a look at this :http://www.youtube.com/watch?v=I6g4OxXmMy0&feature=related
and: http://www.wikio.fr/video/1811047

and the info's at :http://www.bbcm.org/black-and-blue-program/

Each long Thanksgiving week end here we can watch bus coming from Montreal letting go theses participants boys and girls some even with
part of their ballroom dress and suits ;)

P.S. It's not my cup of tea but i should admit CW is old fashion even if i still can have a full QSO on the satellites and on HF... at low
speed.

So in your mind Trevor, the fact that Cp/s and Hz have the exact same meaning is somehow irrelevant? I strongly disagree with you.
This is the big problem with 'book learning'. It creates a narrow field of view of the world where realities mustn't intrude at any cost.

Working in the education sector, I see examples of this sort of stupidity every day. Of course, it make things easy for the teaching staff, who then don't require a broad education to 'teach'.
The only acceptable answer is the book one.

> If you think about it there is little point in teaching archaic units used in the early 1900's. Granted it's an interesting bit of history but not really relevant to Radio Communications in the 21st century.
>
Not so archaic old boy. Check your facts. Some of the radios I was talking about are not very old. Might even be younger than you!

Hertz *means* Cyles per second. The SI unit is based on the Imperial one. Go look it up if you disagree. Sure it's archaic!

Here OM, I'll save you the bother of looking like a complete pillock.

hertz [hɜːts]
n pl hertz
(Mathematics & Measurements / Units) the derived SI unit of frequency; the frequency of a periodic phenomenon that has a periodic time of 1 second; 1 cycle per second. Symbol Hz
[named after Heinrich Rudolph Hertz (1857-94), German physicist]

Bad news when our amateur radio exam system designates two units of identical meaning as somehow different.
Isn't 'education' wonderful :-)
God save our young people from the 'educators'.

The syllabus for Foundation Radio Communications Exam is at

http://www.commsfoundation.org/rce/pdf/foundationsyllabus.pdf

Candidates are examined on what is in the syllabus nothing else.

That *was* my point. The syllabus is being degraded into a nonsense by including such questions in exams. Cp/s and Hz are functionally identical and the 'archaic' unit you'd happily 'lose' *is* in fact the basis for the SI one. To 'teach' people in this limited and shortsighted way is to deny them a proper and balanced education.

I see this sort of garbage on regular basis at work. It's generally referred to as 'ticking the boxes'.

It's done of course, to make teaching and marking easier for those tutors with a limited understanding of what they are teaching. Stock answers are very convenient for marking purposes.
We do have a few people here who have worked in the 'real world' and boy does it show in the way they teach. The real problem is that we just have nowhere like enough of them.

For those that missed the point.

When one had to 'learn' something and prove it had been learned by taking a written exam where the answers were *NOT* given beforehand, in my opinion, that made for better qualified people than the random guessing game where the correct answers *ARE*given and one just has to choose the correct one.

Recently, a Scottish amateur had a question marked as *INCORRECT* for writing kilocycles instead of kilohertz. Surely! a case of hairsplitting we could be without?.

From: Luc Leblanc
Topic: 2866 Message: 2866

"The new AMSAT CubeSat's initial capability is planned to add to the popular low-earth orbit FM transponder fleet
allowing hams to continue to use their existing handheld and portable antenna systems. This also continues the accessible
entry path for new satellite operators to get started. The existing FM satellites are starting to show their age."

It was widely admitted that AO-51 was a mistake years ago as a transponder type satellite should have been chosen instead of a single
channel satellite.

IMHO There ia already enough capabilities with the existing fleet SO-50 AO-51 AO-27 ISS cross band repeater for an entry class satellite
plus many cubes in the making as arisat-1. What we lack is a HEO or some AO-07 like satellite with transponder who will make
transcontinental QSO'S possible. Theses one channel satellite are a waste of money compare to a transponder type as many simultaneous QSO'S
can be achieved at the same time.

But theses issues where widely discussed in the past and i'm guessing the AMSAT symposium attendance widely clapped at this announcement!!!

What AMSAT-NA will be in the next years " HANDHELD CLUB" as written " to continue to use their existing handheld and portable antenna
systems."

Wrong direction again 180 degrees of the logical course again!

P.S. It is obvious this variation on the same subject proposal will have plenty of time to evolved or to be put in real service only to be
replaced by other new proposals. it is the dog running after his tails syndrome who prevail again. Bottom line is another deceptive
unrealistic proposal IMHO.

Feel free to agree or disagree but the shrinking AMSAT-NA membership is probably what's is triggering theses proposals a king of safety
buoy for the BOD to avoid drowning the whole crew and her ship.

Well Luc and the group, there's always an easy fix if you don't like what's happening... just shift your allegiance and subscribe to something you believe in. I have done, and just like anything else I subscribe to, like my home insurance, or my phone supplier, I realise that there is a choice. There are quite a few AMSAT groups out there to choose from, doing different things, and of course some groups that only collect money for other groups :-) If you don't approve of the decisions made by the group you are a member of, you can always go elsewhere. At the time, I thought that AO51 was an incredibly daft idea and a complete waste of valuable resources, and I still do. I voted with my feet after AMSAT-UK decided to help fund AO51 and joined AMSAT-India instead. I was told at the time I was certainly far from alone alone in abandoning ship. If the Russians were still in the game, I'd happily chuck money in that direction. The RS birds were a load of fun. There again, if an AO7 replacement was on the cards, I'd help fund that instead! HEO's, Molniyas? ZZZZZzzzzzz. I'd rather watch paint dry :-)

Hello Al and group

In general you are right. But there is also an emotional reason for a membership. But OK, everyone is free to join his preferred club.

Why not join AMSAT-DL ? There is a HEO waiting -> www.amsat-dl.org
Why not join AMSAT-ZL ? There is KiwiSat waiting ->
http://www.kiwisat.org.nz/

More projects:
- SSETI-ESEO is suportet by AMSAT-UK
- SATEDU by AMSAT-France - Status unknown ->
http://www.amsat-france.org/satedu/
- PehuenSat-2 by AMSAT-LU - Status unknown ->
http://www.aate.bizhosting.com/Proyectos/Pehuensat/pehuensat.htm

- Satellite on a PCB by AMSAT-OZ - Status unknown ->
http://wiki.amsat.dk/index.php/Main_Page
- FUNcube by AMSAT-UK - New -> http://www.funcube.org.uk/

There are 6 other AMSAT organisations you can join to support their project.

About AMSAT-NA I'm very disappointed. If I would be a member, I would leave this organisation now. I had the hope, they would revive their Eagle project or in minimum, in spite of ITAR, they would support Phase-3E. And now ? They want a CubeSat ! Zzzzz... This are steps backwards, like from the University to Kindergarten.

A lot of $$$ who should better invest in achieving P3E rather than sending another FM single channel LEO repeater cube

> 3 - How would you propose paying for that direction?
>
I never see a clear financial and funding projected structure in years since AO-40. On any project when the goals are set and the money
target is clearly establish the hard part will be to regroup all the international AMSAT'S and all the potential funding sources:
government, spaces agencies, universities, amateur radio association eg: ARRL, RAC, RSGB ect (Some of them already contribute to P3E)

The funding solution will go by an international funding campaign and by a fixed minimal contribution per amateur who want's to have an
HEO. I am member of a local marina and each new member should pay a one time Dredging Fee of 250$. The marina is open here from May 15 to
October 4 about 5 months. I can used a satellite 12 months am i willing to pay 250$ a year YES and could be more if a sound international
structure with well defined planning and objectives can demonstrate a serious will towards the next HEO.

There is already a lot of dedicated peoples around the amateurs radio satellite business who are only making their own small things in
their small backyard. Why not regrouping their energies and money towards "ONLY ONE SINGLE" big project? In the amateur satellite world we
called that a HEO satellite as AO-40 and as AO-07 AO-10 AO-13 generation who where the first steps towards AO-40.

Just to be clear my opinion is not against the collective effort and people works but against some of the objectives they carry. Volunteers
motivation should be the best interest of all not the few.

Feel free to come back this is a very wide subject of discussion with many possible outcome.

Hi Thomas.
I did take my own advice quite a while ago and donated to Kiwisat.
Sometimes, even I think that I occasionally talk sense :-)
Emotional reasons? I'll skip on that. and HEO's IMHO are boring, so I'll skip on that also.
Ditto Cubesats. As I said, you *always* have a choice. Although some might find this strange, there's far more to AMSAT than only what AMSAT-NA and AMSAT-DL are doing. I think the Americans in particular often forget this fact, and lest anyone thinks I have a 'downer' on the Yanks or the Germans, I don't!

We have many friends in the US. Also Canada New Zealand, Portugal, Brazil..... none in Britain, but plenty around the World. Shades of Tony Hancock in 'The radio Ham'. (He's only joking!... LA2QAA)
There are fine people everywhere you look in the World.

I got an overwhelming amount of mail private and public and it will take a bit of time to answer them all but rest assured you will get an
answer back.

Even if some are making an association with Lucius Domitius Ahenobarbus he was falsely accused of setting the fire but at that time he was
out of Rome. Again how can i be wrong when i say It was IMHO?

I'm just reporting the past AMSAT-NA actions or inactions and disrespectual commenting about others opinions. It is again clearly well
presented by Mr Bob Mcgwier as:

"You are just as full of crap now as you were before I stopped reading this at the end of my term as director and officer."

"PLEASE for crying out loud, go into a winter wonderland cave and hibernate for a winter."

But what i am saying since i don't remember how many years is just clearly written in his few lines by a former AMSAT-NA director:

"It is my opinion, given much input from several sources, that AMSAT-NA
has been harmed directly and substantially by the conduct on this BB.
Be grateful I am a has been. If I were a director and had this input,
I would move to turn this thing off tomorrow rather than let it continue
another day and do the damage notes such as yours and others do to the
organization in being viewed by outside people."

If the actual AMSAT-BOD failed to condemn this attitute and conduct it will only mean that this "OLD" AMSAT-NA trend is still present in
AMSAT-NA. It is not me who try to blackmail his own BOD but failing to respect opinions of the others this way is one of the major
contributing fact for AMSAT -NA disintegration.

What's options remains building a cube sat in hurry to patch the whole made by past wrong decisions as admitted for the first time be a
past AMSAT-NA director:

"We made mistakes in dealing with this issue. We have remedied these mistakes.

I'm not second guessing anyone here i freely express my opinion and for the first time a past AMSAT-NA director openly agree with what i
think and wrote first here in this thread and i quote:

"There is only one way I can see we will get to HEO. That is partnered
with the world and most especially with AMSAT-DL who have a complete
satellite but need some things from AMSAT-NA, promised before the ITAR
hammer dropped on us"

Well done Bob on this one this idea is share with a lot of folks here and in Europe too (this text is also posted on AMSAT-EU group
reflector)

AGAIN i am not again the FM/handheld sat user but as i already wrote AMSAT-NA was looking at the passing train exceeded on its line by the
universities cascading cube sat launch. Yes AMSAT-NA plans is to be back on space it was not in their original goals and mission? This
water whole plug will only put another cube in the air not love is in the air...

A fact remain there is a cross band repeater collecting space dust in ISS, IT IS THE BEST ENTRY SAT FOR THE AMSAT'S" Why not putting it in
service? it is the biggest assets for the international amateur satellite community AND HE'S NOT WORKING AT ALL!!! Did someone is sleeping
on the switch wake up your EASY SAT is there just switch the switch on for god sake.

You can not imagine how many comments i received when ISS was put in cross band mode even CB.ers where listening from their car scanner and
numerous ham's where able to have a QSO with their mobile cross band radio.

Do you wonder why the actual FM sat are empty? It is only because they are TOO WEAK to be easily copied by simple apparatus eg: mobile car
antenna rubber duck and so on clothes hangers chicken fence wire stuff. Even a new cube on the block will not help at all. WOULD YOU PLEASE
just switch the ISS cross band repeater ON and have someone sit on it to keep it ON and you will have it your "&5X!| EASY ENTRY SAT.

Just returning to the regular programming...please don't adjust your screen.

2872. 13cm antenna

Yahoo group: eu-amsat
Date: 2009-10-22 21:20:11 UTC
From: g3wie
Topic: 2872 Message: 2872

Hello everyone,

Still working on my antennas and related bits. I've cut elements for crossed-yagis - 6-ele for V and 10- ele for U and have fibreglass booms ready to drill. I'm now working on a box with preamps, filters and phasing/switching for the CP which will be up next to the antennas. As I have an S converter I'm thinking of building that into the box on the mast at the same time. (L will wait for a bit....)

I've searched around for suitable antennas for S and not found much beyond reference in this forum to a 19-turn helix used indoors. I can make such a thing, but does anyone have any more guidance?

Tia

Hello Chris

To listen on the S-band downlink of AO-51 I would make a yagi antenna
with a big reflector. AO-51 is linearly polarized on S.

Chris,

I have built 13 cm antennas from the site of G6LVB and N4WYK all with PVC.

N4WYK's antennas is no longer at his website, but I can scan the construction documents for you and email. When faced with getting quickly on AO-40, I constructed N4WYK's 16 turn helix .

Here are some good websites for 2.4GHz helix antennas.

2. http://ve2zaz.net/

Select 2.4 GHz helix.

3. www.g6lvb.com/

Select quadruple helix for AO-40.

4. www.qsl.net/ve3cvg/antennas/2400/

If I can be of any help, please email me.

73,
Mike

Hi Jon,

I dont see why not, so long as the input coupling/DC blocking capacitor(s) inside the radio is/are of sufficiently large value to pass the 67 - 254Hertz tones. Go try it I say! Packet uses 1200/2200Hz tones so of course you may have to adjust the value of the capacitor to suit. Worst case is that it just wont work, so you don't have a lot to lose :-) If you have the schematics, you should be able to indentify the capacitor(s) involved in the signal path. I don't own a 736 but if you cant get it to work, contact me off-reflector at gm1sxx@... and I'll try to help.

2884. Separation of 2/70 yagis on the same boom

Yahoo group: eu-amsat
Date: 2009-10-28 17:55:29 UTC
From: g3wie
Topic: 2884 Message: 2884

Hello All,

I'm now starting to cut materials for my antennas. I have to keep them to a modest size as the rotator (TV-style with 38mm pole - about 1.5m of the pole above the bearing) isn't going to handle anything huge, and neither will the neighbours. So I'm planning on crossed 4-ele for 2m and crossed 8-ele for 70cm, mounted as close as sensible on a horizontal boom fixed at about 30 degrees elevation. I have fibreglass tubing for the antennas and the boom

What experience does the group have of the effects on the radiation patterns of the spacing between the antennas?

I could fire up EZNEC and run models to see the effects but as I'm a bit lazy I thought I'd ask first. I could estimate the spacing if I knew the capture areas, but that's related to the beamwidth and I don't have that data. The 2m yagi is about 1 wavelength long (6dBD?) and the 70cm is about 1.5 (10dBD?).

Chris g3wie

Just beware of the note "Centerfire Antennas are made in the USA!" but the price is right as the Japanese car price. Is it reliable at 41$
i don't even care but my "new" 2004 chev Impala hit me with many features who where not even expected from my past 1998 Mercury sable.

Why paying for an arrow when we can buy cheap arrows! As they says cut and run with bow and arrow. (Turkey hunting)

P.S. Posted also on EU AMSAT group just in case this one fell into the bit censorship bucket :)

2887. ARES 1-X 10 0n 10 launch

Yahoo group: eu-amsat
Date: 2009-10-29 04:24:47 UTC
From: Luc Leblanc
Topic: 2887 Message: 2887

I just review my DVD recording of the ARES 1-X launch, what a spectacular launch for the tallest rocket in the world. It was amazing to
see how in 3 years this rocket pass from a paper sheet to a 300 foot rocket.

But it could be the first and the last launch for this amazing 450 millions rocket project. It make's me remember the numerous AMSAT-NA
post AO-40 failed project. I now know why and how things evoluate from the 1960 Redstone/Atlas and Mercury project failed launches to this
brilliant ARES 1-X success... a 500 Hockey mark.

The human factor and knowledge! experience came last as it's often just to confirm the process of bad decisions.

Will ARES 1-X survive? It can at least be a wonderful amateur radio satellite launch opportunity but for this it take's will and
leadership! A very hard to find resources when ITAR is so easy to invoke...

Hi Jon

I'd seen the g3sek reference and it has a good explanation of capture area etc. I also looked at L E Cebik's site at
http://www.cebik.com/radio.html
where he had run some models for vertically stacking 2m yagis of various sizes at different distances. Looking at the 6 ele example 1.3 wavelengths seems to be good, so I estimate 0.65W to be the edge of the capture area. (Ok it's an ellipse so it would be more for bayed horizontal yagis but for X config I'm guessing it's ok-ish to use that figure). Similarly for 9 ele 1.5W comes out well so that's 0.75W. Using those distances for my 4ele/2m and 8ele/70cm says that I should space the yagis at about 1.8metre centre-centre if I want to position them so they are both outsider each other's capture area, or 1.3metres if I'm prepared to put the 70cm inside the 2m capture area (per g3sek's article.

I wonder what you are using for antennas/spacing?

Interested in the desense; I was proposing to use filters (coax stub on 2m and VE2ZAZ for 70cm) but would be happy to get away with not doing it!

Hi Chris, both my antennas are home brew, I have 2x5 elements crossed which is DK7ZB design and 2x12 elements DL6WU design they are spaced 2.4 metres apart.The 70cms antennas are horizontally polarized and vertically stacked at the moment.(I'm having problems building the phasing harness for left and right circular polarization.)
I dont get any desense at this spacing with the 2 metre antenna in the X position, i found this helps quite a bit as i used to suffer quite bad desense when both antennas were horizontal.
Cheers Jon G7TZZ

2890. Software for antenna rotators control

Yahoo group: eu-amsat
Date: 2009-10-31 20:29:55 UTC
From: Codrut
Topic: 2890 Message: 2890

I am sure that you will find usefull this program, named "PstRotator".
http://www.qsl.net/yo3dmu/index_Page346.htm
PstRotator handles almost every controllable rotator in common use:
Prosistel "D" and "C", RT-20 and RT-21 Green Heron, DCU-1 HyGain, RC1 MDS, Rotor-EZ Idiom Press, Easy-Rotor-Control, Yaesu Az and Yaesu Az/El GS-232A and GS-232B, M2 RC2800, AlfaSpid RAK Az and RAS Az/El, Easycomm, ST3 Fox Delta, Endeavour Electronics AutoTracker, ZL1BPU, EGIS, Create RAC825 and VK5DJ.
PstRotator can control two diferent rotator controllers: one for Azimuth, and one for Elevation. Or an Az+El controller.
PstRotator provides automatic tracking for satelites and EME, using programs like WXtrack, WinOrbit, Orbitron, Nova for Windows, Sat_Explorer, SatPC32, WSJT, VQLog,TACLog, Z-Track, GJTracker, EME System, Trak_SM.
Also it works with some contest loggers like N1MM and Win-Test.
PstRotator supports multiuser remote control over TCP/IP.
A good positioning precision using 6 or 8 digits for qra locators.
I hope that you will like it!

73, Codrut - YO3DMU

Ok thanks, Jon

Don't think I can manage 2.4m spacing so I'll do some tests with smaller distances (and maybe some models) before I push the whole thing up in the sky. I'll post back with any results worth sharing as there doesn't seem to be much hard info about what works and what doesn't

As we can read on the AMSAT-NA web site there is an operation group who is supposed "to create the monthly schedule for the satellite. AO-
51" But who is on this command team? Why it take's on paper 5 folks to create a schedule? Is theses same folks cannot also be able to
command the satellite? It will reduced the work load for Drew as he seems to be the only one to cope with the all work load and if he's not
available the world stops until he can resume his work on the satellite.

Here is what it is written on AMSAT-NA web page

"The AO-51 Operations Group is made up of Amsat Members who are also AO-51 users. The Operations Group works with the Command Team to
create the monthly schedule for the satellite. AO-51 Operations Group is KO4MA, N8MH, OZ1MY, VK5HI, WA4SXM, N8BBQ, KD8CAO."

PS. A team is normally made with 2 and more:)

From: Thomas Frey
Topic: 2894 Message: 2894

Hello All

Yesterday I found a new russian satellite with DOKA downlink. It was UGATUSAT with the NORAD number 35869 on 435.490 MHz FM. An orbit later it was not active while the satellite was also not over Moscow. It was not transmitting in CW. Can anyone observe and confirm it ?

Hello John

I'm not interested in DOKA itself, but in the russian satellites who transmits DOKA over Europe. They all are intruders in the 435 MHz band and are more dangerous as the CubeSats, which are coordinated to the 437 MHz band. On 435 and 436 MHz we have our AMSAT OSCARs QRV. Its also dangerous to "legalize" this MicroSats, if they have a CW-beacon which transmits "RS22", "RS30" or whatever ID on board.

We have enough problems on 70cm, we DONT need this russian intruder satellites. I hope, the right person reads this mail and can put the first stone.

Topic: 2895 Message: 2897

Hi Thomas,
This is pretty much what GM1SXX and myself have been warning about for several years now ... only to be well and truly 'flamed' for our efforts.

Personally, I was accused of perpetually criticising Amsat and 'NOT' supporting it.

(The Observations column in The Amsat Journal, Oscar News, the recruiting and the President's letter were apparently not supportive of Amsat - (or so I was informed, by one of the current board of directors).

Now, as everyone can see, the 'intruders' have not only gotten themselves 'legalised', they've succeeded in getting half of the Amsat decision makers justifying their cause in the guise of ...

1) Maybe we can get a ride to HEO ... etc ...
2) Education.

Exactly how many of the youth having had a QSO with the ISS will become space engineers do you think?.

A fun thing, yes, useful? (learn geography) no doubt! ... but becoming a space engineer? hrmm ...

I want to make it perfectly clear to anyone reading this mail that the above - *IS MY PERSONAL OPINION* - and should in no way be construed as the opinion of any other radio amateur.

Allowing non-amateur stations to use amateur frequencies started the rot -
(I fear it's far too late now to stop it).

The 2m band used to be exclusive - but on 70cm we're way! down the list of users.

Even the Salmon farm just outside my flat is putting all manner of QRM on 2m now.

The regulatory office responsible for radio interferrence complaints in Norway was disbanded and shut down several years ago. Now it's a free for all.

My transmitter is bigger than yours - (just like AO-51) - and Amsat are proud of the fact that they're going to give us another!.

Membership views? ... who cares what the membership thinks ... we saw the results of Richard Limbeare's referendum several years ago.

Why would anyone suddenly wake up and notice 'intruders' now? It doesn't make any sense to me. We have had 'intruders' for a very long time, yet nothing much has been said in the past, except by a very few people who actually care about the issue.

I can't see why anyone would be so concerned about one or two birds transmitting DOKA information yet *not* complain about University 'me too' downlink only CUBESATs that also carry absolutely nothing of interest to most radio amateurs looking for transponder based birds.
And yes, I did read the part about frequencies.

The rot started a long time ago and the distinctions between amateur and commercial birds seem to have continued to become ever more blurred, and some agencies obviously just ignore the IARU, and the planning process.

John Hackett LA2QAA and I have been complaining about 'intruders' for years, but long before that, John Branegan GM3IHJ also wrote about intruders in his excellent SATGEN bulletins. SATGENs can be found at..
http://www.observations.biz/Satgen/index.htm
I can particularly recommend reading number 268.
In the past, Pat Gowen G3IOR regularly reported on satellite intruders.

'Intruders' go back a very long way. SATGEN mentions them in Bulletins no. 4,5,7,8,9,11.17,19,20,21,22,24 &34 They are absolutely nothing new.

AMSAT are not the only players in the 'amateur satellite' game, and have not been since the days of the Radio-Sport birds. In fact AMSAT are fast becoming the outsiders in the 'amateur' satellite game, thanks to all the university driven non-AMSAT birds that will no doubt have 'AMSAT OSCAR whatever' token names bestowed on them after launch despite the lack of any connection, or practical use to the organisation's members. We will soon be in the situation where most of the 'AMSAT OSCARS' have nothing whatsoever to do with AMSAT except for an 'honorary name'.

This genie escaped from the bottle a *long* time ago. It's way too late now to apply a fix to this particular problem. This email represents my personal long-standing view, which of course anyone with an interest is free to agree or disagree with as they see fit.

From: g3wie
Topic: 2884 Message: 2899

I've just uploaded a powerpoint file with the results of my simulations of a side-by-side 2m and 70cm yagi, where I vary the spacing from 2 metres down to 0.725m where the reflectors are nearly touching, and plot the radiation pattern for the 70cm antenna. From a quick glance it looks a bit too good to be true (these *are* simulations), as the radiation pattern only starts to show noticeable distortion when the spacing is down to about 0.8m. The SWR shows no significant change, though you can see the impedance change (it passes through j0 at some point).

The yagis are both to the WA5VJB design; 4 ele for 2m and 11 ele for 70cm. There's no boom in the model as I'm using fibreglass (and still thinking about how to run the feeder away). I've not simulated X-yagis as it's pretty tedious entering the data and it seemed that antennas in the same plane would show the worst interaction. Likelise I have't (yet) looked at the effect of the 70cm yagi on the 2m one.

I've just remembered these are free-space patterns, so I'd better do it again ;-(with some ground somwhere as I plan to test these simulations in real life on a short pole in the garden or the local park.

Nothing else than asking why all the commanding is made only by one guy and as you wrote "What you overlooked is that the Operations Group
and the Command Stations are all dedicated volunteers, and most work for a living". Having "command station on more than continent will be
a way to split the work.

I'm happy to know "In respect to command stations there are currently two, plus and one in training" and my fear is what will happen if Drew pass away suddenly? Did the team can pick up the task?

Bottom line i'm asking questions as Drew is the only one i saw posting commenting on AO-51 commanding operation and i was unable to get
anything on AMSAT-NA web site regarding the "command team".

Don't see potential issues where there is none! Just relax i'm only asking questions period.

Thank's Colin for your explanations.

I put it in the Files section for this group, in the folder g3wie. It was there when I looked just now.

Thinking about why it looked so "good", it occurs to me that this side-to-side arrangement is not what I'll be using for a pair of X-yagis where the elements of the two antennas will be more parallel. I will model this situation and see what the difference might be.

Hello,

I think the desense is no issue at all. You just have to use bandpassfilters (or just a diplexer or triplexer).

I use ONE antenne for 2m,70cm and 23cm (24 element Log-periodic) and I have a triplexer in line. Thus I can work FO29 (2m uplink 70cm downlink) and even in this "worst-case-scenario" I have no desense.

Concerning the distance between two antennas and the influence an SWR and radiation my personel practical experience is that 1m is enough for 2m and 70cm antennea (even if the literature - which descibes theory says much more)

73 and meet you on the sats

I've now modelled the same two yagis (11 ele 70cm and 4 ele 2m) but this time slanted at 45 degrees so they should look more like half of a pair of crossed yagis.

Again, they don't show much interaction until you get below 1 metre, which seems to confirm what you say John :-). I've got the bits for a pair of VE2ZAZ filters for 2 and 70, and as I have to build the 70cm preamp and put everything in a waterproof box, it's little extra trouble to add the filters. Interesting that you can run through a triplexer. I got one of these for 6 or 4/2/70 but found the loss on 70cm was over 1dB not the promised 0.25.

[I also uploaded a second version of the first models as I had left the SWR out of the 0m8 spacing model]

I will stop playing with the models now and go and put something together. They will go on a tripod in the garden to start with so I will have limited view of the sky. I have been listening to VO-52 on my 6/2/70 collinear and I'm surprised at the strength of the signals, AO-7 is more of a challenge.

2907. AN (interesting) OBSERVATION.

Yahoo group: eu-amsat
Date: 2009-11-06 10:11:50 UTC
From: John Hackett
Topic: 2907 Message: 2907

Group,
I feel the following mail from the Sumbandila Yahoo group deserves a spot on the EU-Amsat reflector.

73 John. <la2qaa@...>
.....

From VK5ALX.

t:

In an earlier post I referred to an observation made during the late night pass over Australia during which interference was experienced from non amateur 2 metre operation eminating from somewhere in lower South East Asia. This interference also occurs when satellites AO-51 and SO-50 (both using a 2 metre uplink) are over the top end of Australia.

I mentioned that the interference was observed while no amateur stations were transmitting (I was the only one active at that late hour) so they were breaking through without the requisite 233.6 Hz tone. It occurred to me that perhaps because of the high CTCSS frequency used there were components in the uplink audio that opened the squelch of the satellite’s receiver.

Today I did some very rough tests with 2 transceivers, an IC910H and a FT897D both setup for CTCSS tone squelch operation using 233.6 Hz tones.
With the FT897D in receive mode I switched off the tone on the IC910H and went through a set of voice exercises, reminiscent of my attempts at amateur theatre. The FT897D’s squelch opened several times. I then read a piece from a magazine and varied my vocal pitch from soprano to, well you know, the other end. Again the squelch opened randomly, mainly when using lower voice registers. Microphone gain was set at a generous level.
I switched the radios, this time using the FT897D as the transmitter. This time I was able to pulse the IC910's squelch showing that neither radio was more prone to this than the other.

Now here’s the interesting part. With both radios set to use tone squelch I spoke into the IC910 in varying voice pitches as before and managed to trip out the squelch in the other radio. I swapped radios and the same effect was observed, much like the dropouts on SO-67. The sensitivity to dropout depended on the voice level and in my case signals only dropped out for a second or so. But, I thought, what if there was some sort of latch in the receiver which required the

carrier to be removed before resetting?
I changed the CTCSS tone to 91.5 Hz and could not produce any abnormal effect.
Whether the above tests and the SO-67 dropouts have anything in common is for the experts to determine.
I’m probably barking up the wrong tree but nonetheless felt my unscientific experiments were worth sharing.

73s
Alex / VK5ALX

Hi Chris, your computer modelled results are very interesting.
I've never needed filters or preamps. I find if you choose a good antenna design (and not some of the rubbish you get in the magazines these days), you get the spacings right and route the feeders correctly you'll find there's no need for all the extras, they just add losses and noise.
I'll be interesred in your working results.
Thanks Jon G7TZZ

Hello John and group

CTCSS is an analogue squelch, so its possible, if a particular tone falls into the chosen CTCSS tone, that the squelch opens. The same observed I alao on SO-50. The chosen 233.6 Hz subtone for SO-67 is too high I think. With 233.6 Hz the possibility is higher for opening the squelch than with 67 Hz randomly.

2910. Re: Separation of 2/70 yagis on the same boom

Yahoo group: eu-amsat
Date: 2009-11-07 20:44:10 UTC
From: g3wie
Topic: 2884 Message: 2910

Routing feeders is another (unanswered) question. I've not yet decided whether to try and approximately balance the antennas on the boom and run the risk that the 2m reflector will hit something in my rooftop arrangement, or whether to put the whole antenna in front of the boom and counterbalance it. I think this will depend in the total weight that results. I found a paper by WA5VJB who measured the effect of a metal mast at different positions along the boom. As you might expect, the effect is worst when the mast is in the same plane as the elements of the antenna. There are some dead spots where the effect is minimal at odd multiples of quarter wavelength (lambda/4, 3*lambda/4 etc) from the driven element - these may be useful if trying to balance the antenna for weight. Although I don't have a metal mast, I do have to feed the antennas somehow, and I suspect the feeder could well upset the radiation pattern in the same way as a mast.

The fun and games continue.

Chris g3wie

> Hi Chris, your computer modelled results are very interesting.
> I've never needed filters or preamps. I find if you choose a good antenna design (and not some of the rubbish you get in the magazines these days), you get the spacings right and route the feeders correctly you'll find there's no need for all the extras, they just add losses and noise.
> I'll be interesred in your working results.

Hello Nader

Google for "transistor BC734". I googled it, but I'm pessimistic to
find any infos or datasheets. Good luck.

Nader,
The UC734B is an old fashioned silicone MosFET transistor that was part of the front end of commercial radio and test equipment.

Often used as an RF amp in a Wadley-Loop configuration in for instance the Eddystone 958

The more modern equivalent is the 3N128 though that too is now becoming a little 'long in the tooth' - (old).

You can download a datasheet for the 3N128 and have the same information since it was a direct replacement for the UC734B.

Hi all
Gentelmen Thomas Frey & John Hackett thank you very much for help & for kind relpies.

I'm planing to build a VHF pre-amp ,so i will put some DC to see
how much dB it can give!

tnx again

Group,
I've taken the liberty of copying Dom's post from the Amsat-bb.

This particular post is aimed at the FM/Cubesat afficiondo.

A listen to the referenced audio file may remind some operators of my previous posts regarding operating proceedure - and the (lack of) standards thereof ...

Mak SV1BSX (RIP)originally coined the description 'ZOO' to describe the AO-51 operating. If he could have heard the European AO-67 sortie he must surely have been doing cartwheels in his grave.

The audio file speaks for itself.

Like Dom says ... NOT ONE SINGLE QSO WAS MADE.

Hi Nader,
Well done!. I liked your post, it illustrated the QRM problem very well indeed.

I was in two minds whether to post my original message to the reflector but now
I'm glad I did.

The serious operators, would-be operators - (and I hope !!! potential newcomers) -
are now beginning to understood the problem with FM satellites.

It's a great pity that Amsat (!) havn't ... but to be fair, I've listened to the operating proceedure in other parts of the world and it's of a far !!! higher standard both east and west of Europe.

I still maintain - (though certain members of Amsat-UK don't agree) - that the standard of operating dropped dramaticallywith the introduction of the *tick box* system of amateur radio examinations, where you can just play the guessing game and get a full license.

It''s extreemly rare to hear trained operators causing QRM. As anyone can hear from Dominico's audio file, it's now become a regular 'free-for-all'.

Your mail illustrates this in an brilliant and humouristic way.

Excellent Nader.

Hi group,

This OM's dearest possession, next to my missus of course! (I'm obliged to say that) ... is really my piece of paper from OFCOM that says "Full License" on it. That and the nice embossed City & Guilds certificate I got from the College of Nautical Studies in Glasgow, where I sat the exam in 1985.

FM is super for rag-chews and is *very* useful to me when out and about, especially on the hills around my home. Many of the locals around here are involved in SOTA and have a great time at weekends with their portable FM handies while getting a nice sun-tan.. or frostbite, as the case may be.
Carrying an FM radio almost certainly saved my life on one occasion, for which I'm *hugely* grateful .... and, as you might imagine, I have always carried one since. I would *never* knock FM as such, but it's useless IMO for satcomms. FM is the *least efficient* modulation scheme one could choose for satellite access. Lots of people, myself included do own handies, but that in itself is not a good reason to put FM in space. Of course, some better operating technique by satellite users could help here, but only help a little. There are too many users in contention for a single downlink, so any QSO is of the 'rubber stanp' type.

Using CW, SSB instead and encouraging better operating procedure solves almost all of the 'access' problems, except of course for problems caused by 'alligators' and 'swishers'. Still, I do greatly like FM. My handie is great! It offers near Hi-Fi audio quality.. on the ground. In the sky... chaos. Like a certain brand of plastic card... I rarely leave home without it, so I'm most certainly not knocking FM. I do agree 100% that my handie is very useful indeed ... on the ground, where it does a great job of work. My dual band handy is *easily* my most used radio, but being generally useful, or very common and 'available', does not elevate FM to being an appropriate mode for satellite communications. That was a 'political' not practical, experiment. IMHO it was a massive flop! You wouldn't enter a donkey in a top horse race, would you?
Perhaps some people thrive on chaos :-), but yes, I agree, my dual band handie is one of this OM's favourite toys.

As to other toys...I don't own or want a car. My bicycle and my feet can take me to most places I want to go. For other journeys, there's the train and the occasional aeroplane. I'm quite 'chuffed' with my new bicycle though.

Have a good day.

Thomas,
I can assure you that GM1SXX was well aware that the 'toy' comments were satirical - (satire - tongue-in-cheek criticism) - but he was making the valid point that ... while FM is a disaster for satellite use it *IS* useful for terrestial communications.

Something I think everybody would agree with.

He uploaded Domenico's audio file as an example of how *NOT* to do it. He made the comment on the RS-10 files so people could compare the two ... and see the difference in operating proceedure between a linear RS-10 and an FM Ao-67.

I repeat what Dom wrote on the Amsat-bb ... despite (because of?) all that QRM on that European AO-67 pass, not one single QSO was made.

The interesting fact (to me) was that Dom was this morning criticised by Andrew Glasbrenner, vice president of operations of Amsat (!) for his views.

That says more to me about Amsat, than Domenico.

Any organisation that cannot accept constructive criticism from it's members doesn't deserve! to have members ... just party yes-men.

As usual. These views are entirely my own.

>

> This OM's dearest possession, next to my missus of course! (I'm obliged to say that) ... is really my piece of paper from OFCOM that says "Full License" on it. That and the nice embossed City & Guilds certificate I got from the College of Nautical Studies in Glasgow, where I sat the exam in 1985.

>

> FM is super for rag-chews and is *very* useful to me when out and about, especially on the hills around my home. Many of the locals around here are involved in SOTA and have a great time at weekends with their portable FM handies while getting a nice sun-tan.. or frostbite, as the case may be.

> Carrying an FM radio almost certainly saved my life on one occasion, for which I'm *hugely* grateful .... and, as you might imagine, I have always carried one since. I would *never* knock FM as such, but it's useless IMO for satcomms. FM is the *least efficient* modulation scheme one could choose for satellite access. Lots of people, myself included do own handies, but that in itself is not a good reason to put FM in space. Of course, some better operating technique by satellite users could help here, but only help a little. There are too many users in contention for a single downlink, so any QSO is of the 'rubber stanp' type.

>

> Using CW, SSB instead and encouraging better operating procedure solves almost all of the 'access' problems, except of course for problems caused by 'alligators' and 'swishers'. Still, I do greatly like FM. My handie is great! It offers near Hi-Fi audio quality.. on the ground. In the sky... chaos. Like a certain brand of plastic card... I rarely leave home without it, so I'm most certainly not knocking FM. I do agree 100% that my handie is very useful indeed ... on the ground, where it does a great job of work. My dual band handy is *easily* my most used radio, but being generally useful, or very common and 'available', does not elevate FM to being an appropriate mode for satellite communications. That was a 'political' not practical, experiment. IMHO it was a massive flop! You wouldn't enter a donkey in a top horse race, would you?

> Perhaps some people thrive on chaos :-), but yes, I agree, my dual band handie is one of this OM's favourite toys.

>

> As to other toys...I don't own or want a car. My bicycle and my feet can take me to most places I want to go. For other journeys, there's the train and the occasional aeroplane. I'm quite 'chuffed' with my new bicycle though.

Hello Al

It was meant sarcastic, in the matter, every man or boy needs his

toy. :-)

As I heard this chaos, only sarcasm can be the answer. I'm also QRV

during the weekends over the "Ooohla boxes", its always an amusement. ;-)

Have also a good day, 73

The (now) infamous 'chaos' file is to be found precisely where GM1SXX said it was (assuming one actually reads the posts).

It's in the FILES section in the SUMBANDILA map together with Nader's excellent satirical comment.

2929. Linear vs. FM transponder

Yahoo group: eu-amsat
Date: 2009-11-11 00:40:23 UTC
From: WILLIAMS M
Topic: 2929 Message: 2929

In my opinion, two simultaneous QSOs from AOS to LOS on a linear transponder is 100% more efficient than the same pass with a FM sat. Then you have to subtract the pass time on the FM sat where the satellite was made unusable by multiple signal QRM. Is it quality or quantity?

This ITAR new strategic issue still does not added up correctly here... as the translation from our German friends who are not present at
all on the AMSAT-NA web site when we can read a lot of english translated articles on AMSAT-DL web site.

Bill wrote in a previous thread:

>As stated earlier, ITAR applies equally to universities, NASA, members
>of the military except when specific State Department
>exemptions/agreements are in place.
>
>Regards...Bill - N6GHz

Could be as he also wrote:

>It's just that most
>AMSAT-NA satellite builders were unaware of ITAR issues related to
>satellites, and just what can and cannot be done to be compliant.

The builders where not aware but what about NASA? Just read this 2001 special bulletin on the AO-40 GPS experiment. SPONSORED BY NASA!!!

Special Bulletin AO-40

* Subject: [amsat-bb] Special Bulletin AO-40
* From: VEFRH@xxxxxxx
* Date: Fri, 28 Sep 2001 09:26:37 EDT

ANS is pleased to report that the GPS experiment on AO-40 has undergone successful testing. This experiment supplied and sponsored by NASA, is to determine if it is possible to get positional data outside of the GPS ring of satellites.

There are two GPS receivers on AO-40, the A receiver for receiving signals around apogee and the B receiver for signal reception around perigee. Both receivers are operational, and Data is passed from the receivers through the RUDAK to the S-band transmitter.

Jim White WD0E, has been the AMSAT coordinator and chief operator for this activity, reports that "we received a signal on the apogee receiver from about 52 Thousand Kilometres out with good signal levels, further data is being gathered and those downloaded so far are being analysed.

Frank Bauer KA3HDO, AMSAT-VP Human Spaceflight Programs, and instrumental in setting up the GPS experiment, said "If this experiment goes the way I expect, it will revolutionise the way we use GPS in Space. Many future HEO spacecraft will be able to take advantage of GPS for autonomous navigation and stationkeeping".

AMSAT President Robin Haighton, VE3FRH, was delighted with the news of the GPS success, and commented that "It is great to be able to help our friends at NASA. Testing this experiment has been a long time in coming, and we were worried that radiation may have damaged the GPS receivers. Now at last we have a very positive result from this important experiment."

Stay tuned to ANS for further details as they become available.

ANS Editor Dan James (N0DJ@...)

If i don't believe ITAR is not a convenient tool used to stay away from any international cooperation keeping the funds for the last AMSAT-
NA cube project the "1U CubeSat" there is a huge PR problem within AMSAT-NA who seems to rely on lawyers trying to explain an open P3E and
P5-A project and what security issues theses 2 projects can represent to the national security?

Knock knock instead of trying to find a way to fit AMSAT-NA in ITAR with exceptions, why not working the reverse way in explaining where
are the security issues in the AMSAT-NA mission and actions? or asking them?

I can believe wearing steel pants i will be quite protected from any potential/invisible external hasard but in doing so i'm exposing
myself to a real visible and well documented internal steel pants issue...

I now know where " the snow will hit the fan" came! It was coming from a hi-rise ventilation worker wearing steel pants.

P.S."This evening´s November 7, 2009 shipment of the first two Soyuz vehicles from Russia to the Spaceport in French Guiana brings
Arianespace one step closer to the next major expansion of its growing commercial launcher family." Is there will be some free ballast
available for an amateur HEO?

Group,
I've taken the liberty of copying Dom's post from the Amsat-bb.

This particular post is aimed at the FM/Cubesat afficiondo.

A listen to the referenced audio file may remind some operators of my
previous posts regarding operating proceedure - and the (lack of) standards
thereof ...

Mak SV1BSX (RIP)originally coined the description 'ZOO' to describe the
AO-51 operating. If he could have heard the European AO-67 sortie he must
surely have been doing cartwheels in his grave.

The audio file speaks for itself.

Like Dom says ... NOT ONE SINGLE QSO WAS MADE.

2932. The operative being ... 'COULD'.

Yahoo group: eu-amsat
Date: 2009-11-11 09:37:13 UTC
From: John Hackett
Topic: 2917 Message: 2932

Like Mike says ... it *COULD* be like this on FM satellites ... BUT !!! ... like I have been 'bitching' about for donkey's years, the European stations would need to learn some operasting proceedure.

Point to ponder ... the gentleman in ther video cited as an example is an American.

As I previously posted - (a long! time ago) - I worked AO-51 over the USA (while connected to Emily W0EEC) on Echolink and the standard of operating proceedure is far! higher.

12 years ago I started a campaign to have the national societies print operating proceedure crib sheets in their magazines. Amsat-UK ignored it completely ... therefore, what can you expect?.

All we can do is hope that the experienced operators lead by setting a good example for the potential newcomers. Ignore completely, the deliberate QRM'ers, they 'WILL* eventually go away if the don't get the attention they seek.

The real clowns - (the awwwwwwlllllller's) - those with pregnant cow stomach problems - we'll just have to learn to live with.

Here's a tip from an old timer ... on CW we all know about the dit, dit, dit, dit ... on voice
a short sharp 1, 2, 3 acheaves the same result.

(don't !!! count to a hundred - use common sense!).

Nota Bena.

Donkey's years = colloquial Manchester slang for - 'a very long time'

Hi All

Tnx Mike for AO-27 video.
Interesting video reset me again to sat mode.
Quite, relax and enjoyable with out SOB (shorting of breath).

Important Notice -

On the entire Pass no one did a loop test!!!!!!
Neither va2sg nor the other stations did a single loop test!

Why here we heard a lot of (OllA) looooping test?

Skill?
Equipment?
experience?
etc

The answer is the key of deferent!

Hi Jhon

So it is a chronic problem . DY = 'a very long time'
Ok add to our operating proceedure crib sheets
Dome's QRM Audio file Mike's(vA2sg) AO-27 vedio File.and try again
As you say its start to work from here (switch- on)other .

Cheeer and thanks OM

73'Nader

If all is publicly open how ITAR seems to prevent disclosure of the very same technology used by AMSAT-NA or anyone else! there is already
know SDR and others widely available technology very well documented....

It will be useful to see the papers issued by ITAR afficionados against AMSAT-NA to see what they have made wrong and against ITAR rules?
They surely pointed out some inappropriate actions and the disclosure of theses inappropriate actions will help a lot of us as many are
already transferring notes schematic data files and so on in a way to share satellite technology between ham's.

I already received some request about DSTAR coding and DSTAR technology information from some universities and i'm exchanging files on the
very same subject with europe can i violate ITAR or those in the US who send me some files are they violating ITAR?

I got at a hamfest a "special" transmitter who was supposed to be a very wide VHF transmitter but the output is made only of white noise
with hissing special effect... as usual i come up with the first conclusion that i got another piece of scrap but pushing a bit more my
search i found it was an exciter part of a power chain apparently made on purpose to transmit only noise... be my guess what the primary
use of this transmitter was but how many of us can stumble on some weird piece of equipment and when making theses items available for swap
of for sale did we violate ITAR?

The disclosure of the ITAR rules apparently violated by AMSAT-NA will only help us to see if we are on the right track or on the side one.

P.S. i got a Power Supply who come up with my unmark noise transmiter it is a Qualidyne switching power supply model 9010E-1Z-001 SN: 70121
it is rated for 1200Watts 12V at 100amps if any one can help me finding at least the schematic in a way to find how to switch it on. Only
the fan start when i plugged it into the AC main.

Thank's

2938. How much is that Soyuz in the window?

Yahoo group: eu-amsat
Date: 2009-11-13 08:41:18 UTC
From: allan_gm1sxx
Topic: 2938 Message: 2938

Hi Group,

I've always wondered what a Soyuz launcher costs and it seems that this snippet from RIA Novosti gives at least a bit of a clue.

The shipment of the first two Soyuz-ST carrier rockets will leave the port of St. Petersburg on November 7. The Colibri cargo vessel will deliver them to the space center in Guiana," a Progress official said.

The Kourou launch site is intended mainly for the launch of geostationary satellites. Its proximity to the equator will enable the Soyuz-ST to put into orbit heavier satellites than those launched from Baikonur in Kazakhstan and Plesetsk in northern Russia.

Russia's Federal Space Agency Roscosmos and French satellite launch firm Arianespace signed a contract last year to launch 10 Russian Soyuz-ST carrier rockets from a separate launch pad in French Guiana near Sinnamari, a village 10 kilometers (6 miles) north of the site used for the Ariane-5, the main European-made booster.

The contract is estimated at $300-$400 million and stipulates at least three launches per year.

So a ten vehicle contract runs to $400m..... ergo $40M/launch.

Hmmmmmm!

ST refers to the launch shroud, which is larger than that used for launches from Russia. The Soyuz ST launcher uses the very versatile FREGAT 'Frigate' upper stage. According to Arianspace Soyuz-2 will have improved performance and be able to carry up to 3 tonnes into geostationary transfer orbit, compared to the 1.7 tonnes that can be launched from Baikonur, in Kazakhstan.

The amount of work done at Kourou to support Soyuz operations was very substantial, requiring the construction of a new launch-pad, railway, MIK building and other major equipment. Kourou requires a moveable enclosed payload assembly building at the pad, and the construction and delivery of this has (from Russia) slowed the project down.

http://www.esa.int/SPECIALS/Launchers_Home/SEMFFUZO0WF_0.html

http://www.esa.int/SPECIALS/Launchers_Access_to_Space/SEM6JRS4LZE_0.html

Soyuz will be a very useful addition for Arianespace but I wonder if the days of 'hitching a lift' at a reduced cost are well and truly over.

2941. Leonid campaign 2009

Yahoo group: eu-amsat
Date: 2009-11-13 15:39:20 UTC
From: Luc Leblanc
Topic: 2941 Message: 2941

Time to check the Navspasur Radar for some echoes.

November 10, 2009: This year's Leonid meteor shower peaks on Tuesday, Nov. 17th. If forecasters are correct, the shower should produce a
mild but pretty sprinkling of meteors over North America followed by a more intense outburst over Asia. The phase of the Moon will be new,
setting the stage for what could be one of the best Leonid showers in years.

We're predicting 20 to 30 meteors per hour over the Americas, and as many as 200 to 300 per hour over Asia," says Bill Cooke of NASA's
Meteoroid Environment Office. "Our forecast is in good accord with independent theoretical work by other astronomers."
The whole article can be read at:
http://science.nasa.gov/headlines/y2009/10nov_leonids2009.htm

And a nice web site on the radar receiving experiment:

http://www.itr-datanet.com/~pe1itr/navspasur.html

Good question John

I can govern myself as i put my my head in the sand ignoring the rest of the world but i have a hobby who make's me communicate through a
medium called "satellite" and those satellites ignore the frontier or the boundaries. There is a wide concensus about extending those
geographical limitations using a satellite with a highly elliptical orbit namely called HEO. There is one in the making in Germany just
near to be completed and a WORLDWIDE AMATEUR RADIO SPIRIT is needed to help them to complete and launch this new HEO.

I'm worried so much about amateur radio satellite that i suggested numerous ideas in the past in a way to help finding a replacement for AO-
40. Could be i'm wrong but i'm only asking AMSAT-NA and namely his BOD to disclose the papers/letters condemning AMSAT-NA and or his BOD or
staff for ITAR violations.

I'm guessing at the last general AMSAT-NA meeting the BOD put in the members assembly notes the copy of those letters from the ITAR
afficionados? If not it will a great help for us and for all the US amateur radio operators to see where they can be wrong in their actions
regarding ITAR.

You are right when you wrote "you don't have to worry about U.S. laws" it's not of my concern but i'm asking only for a disclosure of the
condemning letter coming from ITAR about presuming rules violation by AMSAT-NA.

All the AMSAT financial report are already available on AMSAT-NA web site why not put copy of those letters on the web site? it will not
hurt anyone but it will be a great help for all of those who wants to exchange stuff with US hams and probably numerous US hams who are
probably in a huge void actually about what they can do or not.

When i got a speeding ticket i have a piece of paper and AMSAT-NA probably got one or two letters also?

What do you think about that John?

2943. Re: Linear vs. FM transponder

Yahoo group: eu-amsat
Date: 2009-11-14 05:59:13 UTC
From: yo9gjx
Topic: 2929 Message: 2943

I use to leasen along time AO13 and RS birds and my opinion is that linear transporder is best but only for HEO, on LEO is more eficient FM transporder. A better situation is to build LEO with multichanel transporders and more birds because the number of hams working in sat mode is growing up every day.Also for portable or mobile use FM is superior to linear for fast and handy like comunications.

>

This is an intetesting post but of course I disagree.

Here is why in two words..... "contention ratio".

In network communications (and that includes satcoms),the contention ratio is "the ratio of the maximum demand to the actual bandwidth available".

The higher the contention ratio, the greater the number of users that may be trying to use the actual bandwidth at any one time and, therefore, the lower the effective bandwidth offered, especially at peak times.

So, how does FM do? Easy. It's the worst possible scenario.

Add bad operating manners and Voila... instant "ZOO".

IMHO, the reasons we have FM birds are....
1) FM HT's are cheap and readily available
and
2) Politics.

Group,
I think today's audio recording ought to dispell any doubts about the suitability
of FM on satellites ... at least over Europe !!!.

The audio speaks for itself.

Of particular note is the ON station at S9 + and the SP station continuing to call CQ ...
and then there's the proverbial whistler ... nuff said.

73 John. <la2qaqa@...>
.....
.....

Hello:

I could record the pass over Europe (west) this morning at 9:02 UTC.
The signal of the sat was quite high.
A lot of stations trying to do QSO.
Here you can download the recorded pass here:

<http://www.mediafire.com/file/mmlqyimhyyo/SO-68.mp3>

This was recorded from IN91NQ north east of Spain.

Best regards, 73.
Miguel (EA2BJM)

Hello Florian and Al

In principle and technically I agree with Florian. I was also an AO-10/13 operator and made worldwide QSO's from Macao, Japan to Hawaii. BUT, we have lousy phonie operators without any discipline in Europe, not only on the satellites, also on SW. So I have to agree with Al.

Look to our friends in Japan. In a relative small country with many
HAM Radio operators they have learnd to cooperate.

Hi John and all

No other explanation to call CQ satellite during a QSO other than a complete deafness!!!Part of the solution is a treatment to hearing impairment of their rigs(rig hearing aid device) a Pre-amp!!!!!.
Many stations were not hearing each other at all!!!
(No small ears but deaf Alligator) .

Technically your argument is flawed and I have already explained why. In communications theory, this is what 'contention ratio' is about. I don't need to 'prove' this point. It's accepted fact in the real world. Go do some reasearch if you have a problem with that.

Since Molniyas don't and have never carried FM transponders, they can be discounted from this thread. It's really about modes and manners for LEO.

My opinion....The 'ZOO' problem is in large part down to the inability of FM links to support more than one pair of stations concurrently. This makes users unhappy, and in congested areas leads to the all-to-common 'Zoo' antics. It can hardly be surprising that users get irritated trying to get a few seconds of quiet to conduct the shortest and simplest 'rubber stamp' 'exchange' in heavily populated areas, when dozens of others are all trying to do the same!

Just listen to the audio files.

www.observations.biz/The_Satellite_Zoo/

Linear transponders as we all know support multiple users... in fact as many QSO's as the passband bandwidth permits.

FM is totally limited by capture effect and is only capable of supporting one QSO per time slot. Thats the crux of the problem with flying FM. That and manners. The use of FM of course leads to other unpleasant 'operating habits' that are prevalent but very rarely mentioned. With FM, the strongest received signal *always* wins, this is exactly opposite the 'ideal' behaviour we need to encourage on *linear* transponders, but old habits die hard, so FM is a breeding-ground for 'alligators'.

So if and when these people progress to using linear birds, how do you think they will behave? Do you think they will run the minimum power needed to complete the QSO? I don't think so!

Of course with multiple QSO's possible on a linear transponder, operating standards are better than on FM, because users realise that they don't have to compete aggressively for a single uplink/downlink 'channel'.

Yes, well disciplined operators can make FM work, but this ie Europe and you won't ever see FM work well here. There are too many people with too few manners trying to use a scarce resource.

Damn... I haven't even managed to get around to #3..... politics :-)

Dave,
No, there's nothing wrong with my equipent, I just choose not to join the ZOO on the FM sats.

As for the station you mentioned, judging by his callsign i was operating AO-7 before he was born. Give him a few years, he'll learn.

From: Luc Leblanc
Topic: 2951 Message: 2951

I was late on Sunday mid USA pass but with about 4 watts below an elevation of 4 degrees my downlink was Q5 audio very good but narrow FM
is mandatory to achieved good audio. It seems audio level setting can be adjusted quite high but only in narrow FM mode. Just hope to
conduct further test later.

It seems you have to let the carrier going down and give you reply after meaning having to exercise a strict discipline on that sat and my
guess is it will hard to achieved on this FM one channel sat... When someone is calling another station don't transmit and let the exchange
process completed before calling or answering someone else.

I don't agree with the idea that an FM one channel LEO is better than a transponder one. On VO-52 we can have up to 10 QSO'S on a single
pass at the same time. On a FM repeater satellite it is only one at the time and SO-67 is attracting more users as he's much more powerful
than the other cube and numerous new-comer get on with dualband mobile rig with no headphones resulting in a lot of feedback loop.

It is an entry sat as probably the next one! Could be frustrating sat will be a more appropriate name... ZOO sat can also fit very well and
if SO-67 usage does not come more disciplined he will never be an easy sat but a hard sat making quite impossible to have some sort of any
decent short chat other than callsign/report/grid exchange IMHO it is not what someone who want's to work on the sats need. I still does
not understand the AMSAT-NA one single channel FM sat project. There is already very small tranponder board available made by William
PE1RAH
Why not using one on the next AMSAT-NA satellite?

http://www.leijenaarelectronics.nl/

P.S. One of William transponder is actually on VO-52 with another one YES 2 transponder on the same sat! Is it possible to have some sort
of combo on the next AMSAT-NA project no need to have fancy toys just plain transponder and FM cross band repeater on the same cube both
options will be satisfied as they can be activated in alternance as AO-51 is working

actually.

2953. ZOOSAT.

Yahoo group: eu-amsat
Date: 2009-11-15 18:53:23 UTC
From: John Hackett
Topic: 2952 Message: 2953

Luc makes a very good point re: the term 'easysat' regarding AO-67.

GM1SXX and myself have been making a similar point for donkey's years, though we wern't the first, It was first mentioned by G4IHJ in 1996.

Without net discipline, FM is unsuitable for satellite communications due to the one-at-time nature of the modulation and it's inherent 'capture effect' - encouraging the inexperienced operator to use more power ... MORE POWER EGON, MORE POWER !!! ... (Frankenstein).

Like I mentioned a couple of weeks ago, it's interesting to see more and more amateurs becoming aware of the problems that Commander John Brannegan warned about in the late 90's.

Such! a pity that no-one in the Amsat b.o.d. had the gumption to see the problem.

I agree with Luc, 'easysat' is a complete misnomer.

A better solution would have been a linear transponder and a few online lessons in operating proceedure.

I particularly like Luc's designation suggestion ... ZOOSAT.

Nice! one Luc.

Well done! Nader,
Your latest post is what the EU-Amsat reflector was envisaged to be.

The description of a practical solution to a practical problem for everyone to read and such posts are like 'gold' to the potential newcomer.

People are all too ready to criticise or whinge and moan. (That is 'also' welcome in this group) but I believe it's also extreemly important to give credit when and where it's due.

A very good post Nader.

Hello Nader

I would insert 2 fuses at the 2 resistors. At the next event you will
have no such luck with wire resistors.

From: Luc Leblanc
Topic: 2958 Message: 2958

On my last 8 degrees morning pass i was able to sustain about 4 differents QSO in a row (back to back) It is not an issue on the
transponder probably a new way to avoid pile up? I will have to make further test but the twist is related to over deviation and trailing
tail handling if it's confirm the twist is nasty... and can be only defeated by strict rules of engagement that i strongly doubt it can be
achieved anytime soon on a one channel fm satellite.

Signal reach S9 plus 30 here at 8 degrees and i missed an overhead 83 degrees pass prior to this one :(With ISS it's probably the
strongest signal received here.

It will be nice folk's from Sumbandalia to explain exactly how the TR switching is working. In the mean time congratulations for this very
powerful sat.

Hi Folks,

Interesting post, but I wonder if anyone has considered the possibility that the bird is indended to work like this and perhaps it's not a fault or something to be 'got around' as I've seen posted elsewhere.

Perhaps it was indended to behave this way. Just my 0.2 cents.

Re. the 3 second tail of AO-67

The problem with the 3 second drop-out is a bug in the firmware and the satellite was not designed to operate like that. The 3 second tail was a late addition to the functionality to actually prevent the signal from falling out due to the spin of the satellite etc and the logic got a bit mixed-up. Somehow we did not pick it up with all the pre-flight tests.

We are investigating possible solutions to try and fix the problem.

From: jan.koekemoer@...
To: amsat-bb@...
CC: sumbandila@...

Hello

Given that the SA-AMSAT payload on SO-67 is shared with the satellite back-up TT&C transponder, there is unfortunately not a way to keep the payload switched on permanently, or even semi-permanently. For the lifetime of the satellite we will therefore have to do with active scheduling.

In an effort to make this as painless as possible, I would like to request comments on the possible use of regional coordinators, which I believe worked quite well for SO-35. Such coordinators would then be responsible for setting up schedules in advance for their specific regions, taking into account obviously the pool of possible satellite passes, as well as local events / fairs etc. We would then simply load the schedules on a weekly basis.

Up ‘till now I have mainly focused on Europe, RSA, South America, North America / Canada, Japan and Australia / NZ. I would like to invite suggestions for use of the payload over other regions as well. This adds to the previous point.

Regarding possible activation at night: this is entirely possible, but would have to be planned / managed more actively, given the power limitations in eclipse. We have yet to experiment with this and see what the available capacity would be.

Please mail responses to this bulletin board, or if you prefer, to my work address: jak “at” sunspace “dot” co “dot” za

Best regards

Jan-Albert (ZR1JAK)

Hi Bob

i'm asking myself a couple of questions that i will share with you all.

We can all deduct from your experience that a higher orbit increased the earth footprint. Adding more and more low orbit sat will not help
any US continental operator to extend their contact zone beyond North America condemning them to continental QSO'S.

When AMSAT-NA Says "We're Going Back to Space to add to the popular low-earth orbit FM transponder fleet" are they misleading their
membership or are they using the wrong words? as the definition of "popular" is something favoured by an individual or limited group does
not implies it is so popular for the vast majority of another group.

If this "Going back to space" is only mean "allowing hams to continue to use their existing handheld and portable antenna systems"
regardless of their communication range. It should also be stated clearly. As it was written on the AMSAT-NA web page "This also continues
the accessible entry path for new satellite operators to get started." it should also be clearly stated it will be not only an accessible
entry path but the only one path for them condemning them in an "entry class" forever when they are used to world-wide contacts on HF and
or DSTAR.

If the attraction pole is only focused on an entry class satellite and on the the replacement of the existing FM satellites fleet who are
starting to show their age. can we say it is a poor man choice? Yes it's fun to chase grids and roving along the roads making them
available but fox hunting can be as rewarded too as geo caching is! What is the next step after the "entry class"? The void?

Any short term vision can only lead to short term endeavour, it's a way to buy some time making by analogy a bunch of people playing in
their small backyard where there is only one 2 places swing set. It is a disaster recipe in a small backyard full of children developing
more frustration than the playing benefits. Can we extend this analogy to this "Going back to space" IMHO a bad choice of words.

Again it is only my own questioning triggered by an already existing world-wide class satellite project called P3E. There is no mention of
it in this AMSAT-NA going back to space new deal as if they are in a closed shell or as they are shrinking on themselves. It is a sign of
the time it is so nice in our lazy boy the easy way some will probably says the only one way depending of their state on mind and will.

BAD WORDS CHOICES...

Speaking of bad words choices what about the new Ham Antenna Installed on the ISS Columbus Module quote "Lou congratulated the team, "This
is an example of what can be achieved by volunteer hams working closely with a space agency. This antenna project was funded entirely by
AMSAT-NA"

That's fine but i remember sending some $$ in 2007 as donations where urgently Needed to Get ISS Columbus Module Amateur Radio-Ready. At
the time they called for money quote "The total project cost is 80,000 Euros (approximately $106,500). Amateur Radio on the International
Space Station (ARISS) Vice Chairman Gaston Bertels, ON4WF, says a payment of 9000 Euros (approximately $12,000) is due this month. ARISS-
Europe remains 4000 Euros (approximately $5330) shy of that goal, however, and time is short to have it in place.

You can read the whole article on: http://www.arrl.org/news/stories/2007/03/21/100/?nc=1

A bank account was also open:

"Bank Account Established

AMSAT-Belgium has set up a bank account to receive donations toward equipping the module with the necessary ham radio antennas. "

Is the money goes into the bit bucket? How someone representing ARISS can say "This antenna project was funded entirely by AMSAT-NA" An
explanation is in order here by the writer or by some official in the ARISS group? Again it's not a question about misleading the crowds
but a question of basic plain honesty... ARISS is an international funded group if one of their members wants to get all the credit fine
but a minimal amount of respect should not be mandatory to have a leading position at

ARISS?

I already wrote on the same subject but ARISS or AMSAT-NA remain strangely silent even if i posted the text on AMSAT-EU satellite group a
loud silence remain on this subject. Could be some are sleeping on the switch could be this jolt will awaken them?

In short WHERE MY MONEY GOES? the amateur satellite community is asking for money in a constant and quite aggressive way some times is it
too much asking to know what they do with theses donations? as someone in US says only AMSAT-NA is paying for the antennas!!!

I already contribute in 2007 you can check the whole donator's list at:
http://www.ariss-eu.org/donations.htm

Jim Jerzycke 47,70
Luc Leblanc VE2DWE 18,87
Paul Lenhar II 18,87

> What are you implying here?

Nothing else to try to understand where my money was used for before send any more monetary contribution to ARISS or to any other group
including AMSAT-NA.

> Of course you seemed to miss the part about the V and U antennas and the "and volunteers" as opposed to the L& S antennas which were a separate project conducted by the ARISS Europe team.

It is why i want to get explanations read this article from ARISS europe:
http://www.ariss-eu.org/columbus.htm

Especially theses parts:

it was agreed to work on UHF, L-band and S-band antennas, VHF being too large to accommodate on the Meteorite Debris Panels (MDP) which
protect Columbus ´ hull.
_____

"September 25 th, 2007 ARISS 41-42-43 antennas were successfully submitted to vibrations tests in Germany and ESA decided installation on
Columbus .

October 9 th and 10 th ,2007 ARISS 41 and ARISS 43 were installed on Columbus in the high bay of the Kennedy Space Center . October 12 th
the electrical properties of cables and antennas have been tested and validated.

In the week of October 15, qualification antenna ARISS 42 was successfully submitted to thermal tests in vacuum chamber in the Netherlands
.

ARISS 42 will also be submitted to detailed efficiency tests to determine the precise electromagnetic characteristics of the antennas.

Since September 2005, the Columbus working group has met 17 times per teleconference. These meetings will now intensify in order to
finalize the project for the onboard ARISS equipment. The intention is to build a wideband transponder, L-band uplink, S-band downlink.
Moreover, digital ATV is also thought of. Anyway, among many other aspects, equipment volume, weight, power consumption and heat budget are
to be discussed with ESA and EADS."

> The L & S antennas were especially difficult since they had to withstand the launch environment of the Shuttle payload bay. I think the > >ARISS Europe team overcame very difficult obstacles including
>technical and financial. They are to be commended for their work and tenacity.

Correct me if i'm wrong Louis with this new U/V antenna there is already an L/S antenna installed on Columbus by ARISS-EU? As there is
actually another set of U/V antenna installed long ago on ISS and serving for packet and ARISS contact sessions and for the cross band
repeater? The former ARISS-EU antenna project was abandoned due to various factor and remain on Columbus the L/S antennas and the last U/V
installed this week?

>The operative thing here is performance and achievement rather than talk.

That's AMSAT-NA old rhetoric again Louis just start to set aside this close mentality where as soon as someone is asking for explanations
he's only getting harsh commenting and aggressive answers. If you feel threaten by what i wrote you are probably aware of facts that i'm
not aware of...

From an outsider it look's like as any ARISS group is working on projects at will without any coordination as you wrote "as opposed to the
L& S antennas which were a separate project conducted by the ARISS Europe team." Is there any way to have someone in charge in ARISS lets
say a chief or a captain who can just make's us understand how things are working at ARISS? Not you as you seems to managed the US ARISS
hardware only!

> What are you implying here? You asked!

Why not adding theses line on the AMSAT-NA web page "ARISS Europe team overcame very difficult obstacles including
technical and financial. They are to be commended for their work and tenacity" failing to do so at the first place just make's ARISS look
like a body with no heads where each members are competing instead of cooperating.

On your AMSAT web page text you wrote "This antenna project was funded entirely by AMSAT-NA and volunteers" and "who built the antennas for
both an ESA experiment and for ARISS" The ESA experiment is i guess the AIS antenna but not a single word about the ARISS-EU work, It came
out only after i post my text...

> What are you implying here? You asked!

This

ARISS is an international funded group if one of their members wants to get all the credit fine
but a minimal amount of respect should not be mandatory to have a leading position at ARISS?

I understand you are the ARISS US hardware manager who is working on the ESA Columbus module amateur radio antenna. ARISS-EU was asking
for money in 2007 what i want to know is "In short WHERE MY MONEY GOES? is it too much asking to know what ARISS do with theses donations"?

If it goes in the bit bucket just confirm it! At least they pioneering the actual ARISS-US work in some sort. Why don't mentioning there
works first in your text? Even if their money was going in the bit bucket those in this list : http://www.ariss-eu.org/donations.htm should
probably be concern with your commenting "operative thing here is performance and achievement rather than talk" They finally just give
money on a project they believe in...

I wrote in my previous post:

"There is no mention of it in this AMSAT-NA going back to space new deal as if they are in a closed shell or
as they are shrinking on themselves. It is a sign of the time"

Should i conclude this trend is now extending to ARISS? Just for the sake of clarity ARISS in not supposed to mean :Amateur Radio
INTERNATIONAL space station?

Who is speaking for the head? YOU?

How AMSAT-NA or ARISS will be able to ask for money AGAIN when nobody is able to justify the donations made by some international amateur
radio operators and groups.

If you speak for all the international ARISS group it's fine to used ARISS but here "The new ARISS antenna is very similar to the antennas
already on the Russian service module" could be "new ARISS US" will a better CHOICE OF WORDS?

If you still don't get it just put some of your sentences back to back:

ARISS US Hardware Manager....This antenna project was funded entirely by AMSAT-NA and volunteers....The new ARISS antenna is very
similar...

Not a single word on ARISS-EU...btw

> What are you implying here? You asked!....

Correct me if i'm wrong when i say BAD WORDS CHOICES...

P.S. The devil is in the details.

Luc and Lou

I "heard" that the ATV experiment, for which the L/S antennas was built, died
concerning a discordancy of two ATV groups. The one liked to have analogue ATV,
the other group liked to have DATV. But this could be a rumour.

As you know, without informations there will rumours float around.

This power project is needed for the Ericsson HTs, I think and not for a ARISS-EU project. If this is definitely a rumour, I hope with Luc, that we will be informed about the status of the EU-project from anyone in the ARISS-EU-group.

But I'm hopeless, probably we would never hear anything in the S-Band from the Columbus-module.

Hi Jan

It look likes a bit better than what we can hear here...Main problem station overdeviated and out of uplink frequency could be some cannot
read instructions on AMSAT-SA web page could be a translation in a couple of language will be helpfull? Just in case someone does not get
theses instructions yet here is the link:

http://www.amsatsa.org.za/index.htm

As the signal is very strong could be many stations are trying to get in with less than marginal uplink equipment and the floor/QRM noise
is probably due to this?

The instruction to follow:

The CTCSS tone for the transponder is 233.6 Hz.

Uplink: 145.875MHz
Downlink: 435.345MHz

Additional recommendations:
Use only narrow FM
Switch off compression

Speak softly (mic gain down)

In french:

Notes d'opérations pour SO-67

Fréquence en montée 145.875MHz
Fréquence en descente 435.345MHz

Recommendations supplémentaires:
une modulation FM à bande étroite
Ne pas utiliser de compression audio
Réduire le gain microphonique et parler en réduisant le volume de la voix

Italian

Note d' operazioni per SO-67
Frequenza in aumento 145.875MHz
Frequenza in discesa 435.345MHz

Recommendations supplementari:
una modulazione FM a banda stretta
Non utilizzare compressione audio
Ridurre il guadagno microfonico e parlare riducendo il volume della voce

Spanish

Notas d' operaciones para SO-67

Frecuencia en subida 145.875MHz
Frecuencia en pendiente 435.345MHz

Recommendations suplementarios:
una gradación FM a estrecha banda
No utilizar compresión audio
Reducir la ganancia microfónica y hablar reduciendo el volumen de la voz

Feal free to add and correct the above translations

2971. News about XW-1 from ChinaAMSAT

Yahoo group: eu-amsat
Date: 2009-12-01 13:27:19 UTC
From: Thomas Frey
Topic: 2971 Message: 2971

A micro-satellite for amateur radio purposes is planned. Payload includes Telemetry Beacon,
Linear Transponder, FM repeater, Digital Store-forward Transponder. The operations will all
have 70cms downlinks and 2 metre uplinks. 1 watt output is planned for the transponder and
200mW for the beacon. The satellite is expected to have a mass of 50kgs and be launched from
China into a 100 deg inclination orbit with 1200km apogee. The launch is now planned for 20th
December 2009.
(http://www.amsat.org.uk/iaru/formal_detail.asp?serial=108)

Hello All, this will be a very nice Christmas gift, if the launch succeeds at the 20th December.

Yes, a very nice present from China. All I have to do is shake the snow off my antennas and just wait, maybe this new satellite will start on the 25th :)

With 1200km apogee it's not quite as high as AO-7 but much better than AO-51 and FO-29, so a very welcome addition.

Is it possible to have the next satellite battery system wired in a way to bypass the batteries bank in the event of a failure of one cell
or multiples cells? This bypass will let the solar panel power flowing directly to the sat equipment. If such a system was feasible could
be AO-40 will be with us today? just note i wrote "could be"

DSTAR in Europe (UK)
I see plans afoot to allocate the top end of 144 MHz in the United Kingdom for GMSK (DV) linking (DSTAR) just hope it will not mixed up
with satellite band plan.

Date: 2009-12-06 11:51:33 UTC
From: Luc Leblanc
Topic: 2976 Message: 2976

From Radio HF newsletter. Sheldon is always looking for articles to add into his newsletter feel free to send him yours.

On a personal note this month, I would like to let everyone know that I am returning to the radio airwaves this month. Back in 1987, I created a weekly radio programme called "The International Radio Report" that began airing on CKUT-FM 90.3 MHz. from the campus of McGill University here in Montreal. For 17 years I co-hosted the show with Bill Westenhaver, presenting a weekly half-hour of news and information on the world of radio. When we gave up the show, two friends of ours, Janice and Steve Karlock stepped in to continue the show. The programme continues to air every Sunday morning, live, at 1530 UTC (10:30 am Eastern) on CKUT. It can also be heard live streaming and archived on the CKUT webpage at www.ckut.ca

Please feel free to submit any information for the Newsletter by e-mail to hfnewsletter@....

P.S. You can also subscribe to his newsletter.

Yahoo group: eu-amsat
Date: 2009-12-06 12:47:15 UTC
From: Luc Leblanc
Topic: 2977 Message: 2977

On the 1210 UTC last western pass i found similar signal but a steady 18 seconds (aprox) cycle one deep fade with a couple of small ones.
The western pass are usually not my best ones but i was able to work the satellite from AOS to LOS with some part of the pass with no
signal but i was able to hear something just at the noise floor.

It will be interresting to check the S and L band in this attitude reversal?

2978. FM on linear satellites.

Yahoo group: eu-amsat
Date: 2009-12-06 21:03:12 UTC
From: John Hackett
Topic: 2978 Message: 2978

OBSERVATIONS FROM NORWAY. 0612091745Z

FM ON LINEAR SATELLITES (???).

The circuit diagram and picture for this project can be found at ... <http://www.observations.biz> Observations from Norway.

With the primary aim of encouraging FM satellite afficiondos to eventually upgrade to linear birds I decided to remind operators that it's perfectly feasable to use FM rigs to communicate via CW on a linear satellite, thereby allowing them to "get their feet wet" without buying a new rig..

As stated, this is perfectly feasable, providing two simple rules are applied.

1) *DON'T* use too much power ... you know !!! why.

2) Use a clean sine wave signal for the audio oscillator.

The old timers will remember keying the PTT of their FM rigs to send CW.

For the newcomer, this was called MCW - (modulated continuous wave) - that is to say, simple on/off keying by pressing the PTT.

A bit 'chirpy' but perfectly adequate for 'communicating' ... (a key word for 'amateurs').

It's obvious that those Hams who only own FM rigs are *NOT* going to run to the local emporium and purchase the latest all singing, all dancing multimode rig just to try to work CW.

Therefore, we need a way to acheave that using existing equipment.

The only 'extra' items to your normal FM handheld is an audio oscillator fed to the mic input and a reliable method to key the transmitter.

99.999% of today's FM handhelds (and scanners) also have the facility for copying AM signals.

I mention scanners in case, like me, you want to use your FM handheld to TX and tour scanner to RX, that is to say, full duplex ... though judging by the 'zoo' on the FM satellites, very few amateurs have understood the principle of full duplex.

Without delving too deep into the realms of the technology of 'How's' and 'Why's' the scenario is this ... The station who hears your CQ call, if he has his brain in the ON position will switch to CW and reply to you - (if he has his brain in the OFF position he'll mutter something like - "There's something wrong with that idiot's modulation").

Assuming he does reply to you in CW, his signal will be perfectly readable with 'YOUR' rig set to the AM position ... (think! before you speak).

You *WILL* be using your dual band FM handheld set to TX on 70cm FM and RX on 2m AM.

The doppler will change slightly more on VO-52 than on AO-7, due to orbital height but remember, most handhelds have about 10.000 - (ten thousand) - programmable memories these days ... (at least!).

Now !!!, at last, you've finally found a use for some of those memories.

Most operators are familiar why one should *NOT* use too much power - particularly on FM so I won't go there.

The other criteria is a 'clean' oscillator signal that is *NOT* a square wave - (that's the NE555 out, then). You don't !! want a signal that sounds like a regurgitating water buffalo.

The following is an explanation of the system I use - (see circuit diagram and pic).

The 'oscillator' is the audio output from a homebrew electronic keyer that is a clean sinewave. This is fed to the mic via an attenuator (if necessary) since FM rigs don't usually have an external mic gain control.

My IC-E92D is such that to TX, the barrel and the tip of a 2.5mm jack need to be shorted. I acheave this with a small relay mounted inside a 'scavenged' laptop computer power supply - (see pic).

To do the actual switching, I use the 'grounded' PTT signal from the keyer via a PNP transistor switch feeding an NPN relay driver. The PNP transistor also controls the relay's 'delay' via the RC time constant components to alleviate any relay 'chattering'.
The hold-in time can be adjusted with the 10k potentiometer.

The electronic key is built into a spice box purchased at the local hardware store.
The paddle is a pair of micro switches 'RIPPED* out of a joystick, albeit, not 'Bencher' class but perfectly adequate.

On high elevation passes it *IS* possible to work VO-52 with low power and a whip - (your rubber duck does *NOT* belong in this equasion) - so you can work portable CW with nothing more than a handheld FM rig, a keyer and a small box toted in a shoulder bag.

NB.
For aerial recommendations and amount of power etc see elsewhere in OBSERVATIONS.

You *DO* have a pair of headphones in your shoulder bag, right? ... silly question, of course !!! you do - AND !!! you know why, don't cha' ... (feedback).

A bit of *GUMPTION* is required to work low power CW using an FM rig on a LINEAR satellite but IMHO that's what amateur radio is all about ... communicating and experimenting.

Points to ponder.

After checking your dictionary - 'gumption' (Manchester slang) can be loosely translated into- 'operating proceeedure'.

Contrary to popular belief from some of the self-professed 'experts' - it is *NOT* forbidden to operate FM on a LINEAR transponder ... however, it should be obvious that one should definately *NOT* !!!! use 300 watts to a 10 element beam on FM ...

(As seems to be the case on AO-67 and AO-51).

C'mon !!! guys, I was kidding.

The whole object of the exercise here is to encourage people to try something different.
It's aimed at those who *CAN'T* afford to splat out 2 years income on
one of the latest, greatest rice boxes ... (like LA2QAA !!!).

I *KNOW* not everybody is a CW fan but in my opinion it takes a little bit of skill to use the mode, and therfore, is a lot more rewarding.

IMI barred - (repeat).

My opinion only , I do *NOT* ask anyone to agree with it. It's merely a suggestion.

Read ... digest ... even if you only mutter ... eejit!.

Here follows a transcription of an FM voice QSO on AO-67 today.
.....

WB9ATU this is KN1AN, EC60FU over

WB9ATU Roger 73.
.....

now tell !!! me that you don't find that exchange both exhilarating and exciting.

An *EXCELLENT* use of satellite resources - showing the extreemly high technical competance of two radio amateurs.

Little wonder the general public perceive radeio amateurs as technologically advanced 'experimenters'.

A prime example of the usefulness of an FM signal via satellite ... (while blocking all other lower powered signals, of course).

Surely!, you'll now jump on the bandwaggon and agree with Amsat-NA that we need more of this kind of satellite to further 'education'.

(He means sell out, to give the great unwashed the opportunity of getting a few free points at the expense of Amateurs losing their once dedicated 2m band).

Seriously, is this the future of amateur satellite operating? ...

Unfortunately, the answer appears to be a concise yes.

Thank's John for your recordings you ended up with the same conclusion i draw in a previous post eg:

From: Luc Leblanc <lucleblanc6@...>
To: amsat-bb@...
Subject: I found the twist on SO-67

"I will have to make further test but the twist is related to over deviation and trailing"

The "trailing" is the key word here and with the help of the capture effect and the full duplex and some practice you can managed this 3
sec affair without any golf club...

Lets say i'm busted by John... I'm not too convince this will help the nation but it will make's things more even for all of us
"the sinners" but just remember "let he without sin throw the first stone"

I ended up at "trailing" on my previous post...but you are 100% right but as i often use
the ridicule as a proving tool any sound human can
only reach the same conclusion.

I already wrote this:

"I will have to make further test but
the twist is related to over deviation and trailing
tail handling if it's confirm the twist is nasty... and can be only defeated by
strict rules of engagement that i strongly doubt it can be
achieved anytime soon on a one channel fm satellite."

Why using it you will ask? exactly the same answer sir Edmund Hillary give "why do you want
to climb this mountain? (answer) Just because
she is there"

Unfortunately we are in a poor man choice mode as HEO seems to be out of reach money
speaking but we are also very short will wise as they
are in a recovery mode. Poor man excuses P3E project is alive but they invoke ITAR as an
other way to try to avoid to support more P3E in
sending more money to them.

Bottom line there is two choice use it or not. Try to use a terrestrial CTCSS repeater with 50 operators at the same on a 10 minutes
period, you will ended up with the same results. Why not at least using a cw/ssb transponder? i already ask this question but i got no
answers as usual AMSAT-NA knows best...

AMSAT-NA with his entry class minding seems to have no future plans as they are focusing only on short term targets.

P.S. I was on a very low pass this early morning on SO-67 i was able to conduct an AOS to LOS QSO with only one station chatting at will.
If AMSAT-NA does not understand that an entry class satellite is made for only 2 stations at a time it will lead to even more new and old
AMSAT-NA members to get out and return back to HF or DSTAR.

I will not post this one on AMSAT-BB i feel it's best to let them cooked in the same pot. Water will boiled over sooner or later i just
hope it will not be too late...

That's the best analogy I've ever heard to describe the 'zoo' - (why didn't I think of that).

Perhaps if more people considered that analogy, they might be able to understand things a bit better.

Many years ago (in the RS satellite era) I suggested Amsat-UK contact their various sister societies with a view to publishing a recommended operating proceedure for amateur satellites.

Unfortunately, my suggestion was completely ignored.

I still believe such a thing is needed.

... and before anybody says "Why don't you!!! publish one" ...

I have!, together with GM1SXX on the 'Observations' website at ...
<http://www@...> - donkey's ! years ago.

Well done! Luc, I hope people 'think' about your analogy.

John,

AO-7 has been transformed into an AO-51 in the U.S. on several occasions. All one has to do is uplink too much ERP, this makes the transponder usable only to the high power station and the station he is in QSO with. The remaining portions of the 100KHZ transponder is rendered useless.

As far as the present direction of AMSAT-NA, For the HEO, I've been a core donor and bronze donor in the past. I'm afraid AMSAT's new goals are not the same as mine. I'm not sure what I'm going to do.

Hello Mike and group

The way AMSAT-NA is going is a real problem. They have the biggest organisation but looks not over their own border. They goes the easiest way with "Easy-Sats". Sorry Mike, but this is typically American.

We has to know, what do we want ? Only grid chasing ? Or do we want DX ? I for one want to make DX. The DX connections via the HEO satellites AO-10 and AO-13 were very interesting and successful. Real HAM radio. AO-40 with its low inclination was not possible to work on S-Band for me, I live near a hill. But AO-40 was for many OMs a success.

AMSAT-NA has buried their HEO project Eagle and want an 1U CubeSat with an "easy" FM-repeater. This is saying all to me.

We all have a choice, but we have to hit the right one. I'm a member from AMSAT-DL.

Group,
We've now been a group for 5 years.

We are 167 members - on 5 continents - as of December 2009.

One or two were just 'passing through' but membership - entirely by word of mouth - has increased steadily. It's interesting to note that we've never advertised nor sought publicity.

The group has been and will remain FREE to all satellite enthusiasts. Formed primarily for radio amateurs in the summer of 2004 by LA2QAA, SV1BSX and GM1SXX, the group is now open to any serious satellite interested individual who applies for membership.

Applicants *ARE* screened - (to avoid SPAM).

The posting statistics for the first 5 years are as follows ...

2005 223 posts
2006 264 posts
2007 593 posts
2008 1042 posts
2009 769 posts ... and counting.

Thank you for your support.

LA2QAA & GM1SXX ... The EU-Amsat Group.

2986. Loosing the north!!!

Yahoo group: eu-amsat
Date: 2009-12-10 21:32:42 UTC
From: Luc Leblanc
Topic: 2986 Message: 2986

Again my Alfa Spid AZ rotor act again yesterday evening it loose his north setting as it is electronicly set with the control box. Very
easy to reset but in the middle of a snow storm (25cm) i was unable to find something to point the beam physically to the north.

At the same time there was an AO-51 pass i adjust the rotor to an estimated north and i follow the whole pass manually writing down the
real calculated azimuth and the one i got from a maximum signal swinging the rotor back an forth.

I make another pass doing the same operation to fined tuned my pointing and today on the 1549 EDT pass i was able to get the satelllite at
1 degrees AOS ans LOS!! signal was S7 most of the time and reaching S9 near TCA?

I don't know if AO-51 is still pointing towards the southern hemisphere but i notice only one deep fade and signal was much better than the
first attitude change days and i think he never was so strong?

I'm guessing my "scientific" previous north pointing was bad or my UHF beam is shooting not towards he point? I'm always using automatic AZ
tracking could be i was shooting aside of the target for a while...

Just try this on a pass could be you will be astonish too?

If AO-51 was returned back to his normal attitude i will have to reavaluate all of what i wrote above.

From: Luc Leblanc
Topic: 2987 Message: 2987

Each 3 days AO-51 footprint reach eastern NA and Europe. This "very early" morning pass here at 0855 UTC put in range of the east of North
America (me...at least): Northern Europe and most of Scandinavia. The next similar pass will be on Monday December 14 at 0837 UTC. This
pass will cover from a line starting at the South of Spain to the north border of Italy covering near the whole western European continent
UK as well Scandinavia will also be in range.

Signal on this morning low pass about 7 deg here was Q5 S6 to S7. If there is any takers i can set my alarm clock to be QRV next Monday
morning but i know it is a working day could be not the best pass to have a lot of stations but it is not a too bad thing considering the
limitation of a one channel sat.

Best time to have a look over the Atlantic from FN36KA.

Hi

I have found a new info about Yubileyniy-2. at Mika Wakita -JE9PEL website
---

http://www.ne.jp/asahi/hamradio/je9pel/xw1_yubi.htm

Yubileyniy-2 (RS-xx)The launch is now planned for 28 December 2009.

Payload: Gonets D1 M2 - M4, Yubileyniy 2
Launcher: Rokot Briz KM
Paunch Site: Plesetsk Cosmodrome, Russia
http://www.skyrocket.de/space/doc_sdat/yubileyniy.htm

----------avove link stats
The new satellite will feature communication equipment for amateur radio operators and will test new components of satellite avionics.

Any more info????

Fingers crossed at both hands, WX1 Yubileyniy-2

Hello Nader and group

I also "found" Mineo's site. It's not sure that Yubileiny-2 will have
a CW-beacon and a DOKA-B transponder. The last russian satellite with
a DOKA-B downlink is UGATUSAT on 435.4905 MHz FM (!).

On the site
http://www.amsat-dl.org//index.php?option=com_content&task=view&id=46&Itemid=102
you can find all russian satellites with DOKA-B, search for
"DOKA-Transponder"
> Fingers crossed at both hands, WX1 Yubileyniy-2
>

Yes, but only for XW-1. As I wrote before, we do not need more intruders
in the 435 MHz band.

Hello Nader

DOKA-B from N.E. Bauman University
(http://microsat.sm.bmstu.ru/eng/eindex.html)
is a control and information system to communicate directly with the
satellite-bus and has absolutely nothing to do with HAM radio. The
satellites
are not coordinated by IARU and are intruders. Here you can see a picture
from the module: http://www.iki.rssi.ru/kollibri/im10.gif

The following satellites carrying a DOKA-B system:

Mozhayets (RS-20) - status inactive
Mozhayets-4 (RS-22) - status active
Sinah-1 (RS-25) - status inactive
Yubileiny (RS-30) - status active
UGATUSAT - status active

The problem is that the DOKA-B system can only be heard if the satellite is
in view of a groundstation near Moscow or at Kaluga, Russia. See also the
mail from Andy, G0SFJ:
http://www.amsat.org/amsat/archive/amsat-bb/200806/msg00010.html .
When the satellite leaves the footprint of the command station it
switches to
the CW-beacon. Is the satellite then a HAM radio satellite ? I think NOT,
the CW-beacon may be an alibi.

Topic: 2989 Message: 2994

Well Done! Thomas,
It appears that the message GM1SXX and myself have been promoting in the latter years is finally getting through.

(First noted by Commandert John Brannegan GM4IHJ in the 90's - and mirrored on OBSERVATIONS under 'Satgens' for a long! time now).

Let's be optimistic, another 200 years and even Amsat might get the message ... but I wouldn't advise holding your breath.

Actally, I'm rather surprised Amsat is not offering Oscar numbers to the commercial Russian satellites.

Did I say 'commercial' ... oops!, sorry, I meant AMATEUR !!! satellites. They *MUST* be amateur satellites if they transmit in the amateur band, right? ... right !!.

That they are no use to man nor beast (or amateurs) is of minor! consequence.

The universities can collect their telemetry free - all under the guise of 'education'. Just another 'tick-box' mentality step forward.

Hello Nader

DOKA-B from N.E. Bauman University

(http://microsat.sm.bmstu.ru/eng/eindex.html)

is a control and information system to communicate directly with the

satellite-bus and has absolutely nothing to do with HAM radio. The

satellites

are not coordinated by IARU and are intruders. Here you can see a picture

from the module: http://www.iki.rssi.ru/kollibri/im10.gif

The following satellites carrying a DOKA-B system:

Mozhayets (RS-20) - status inactive

Mozhayets-4 (RS-22) - status active

Sinah-1 (RS-25) - status inactive

Yubileiny (RS-30) - status active

UGATUSAT - status active

The problem is that the DOKA-B system can only be heard if the satellite is

in view of a groundstation near Moscow or at Kaluga, Russia. See also the

mail from Andy, G0SFJ:

http://www.amsat.org/amsat/archive/amsat-bb/200806/msg00010.html .

When the satellite leaves the footprint of the command station it

switches to

the CW-beacon. Is the satellite then a HAM radio satellite ? I think NOT,

the CW-beacon may be an alibi.

> I'm beside the radio but all the HF is dead here! this is a good time for DX if we have a HEO sat, Specially if u have insomnia . :-(

From: Al
Topic: 2995 Message: 2995

Hi,

Found the following on Reshetnev's website. Mainly targeted at Express-AM but also mentions Yubileiny and DOKA-B.

http://www.observations.biz/Reshetnev/Reshetnev_DOKA-B.pdf

I have the feeling we'll be hearing more of DOKA-B in future... probably the rather near future, with Yubileiny-2 and perhaps other craft using the DOKA-B. For reasons unknown, the Russians rarely ever seem to properly index web pages, so it can take a lot of 'digging' to find any information of interest.

Hi Group.

This is why I posted the item. Why do you think that a handful of individuals (myself included) have been complaining for many years about the takeover of the amateur satellite sub-bands by 'educational' and 'other' satellites.

My own view is simple.
My Rule1 (of1)
No amateur transponder onboard = NOT an amateur radio satellite.

AMSAT-NA see things differently. Got a downlink in the amateur bands? Welcome aboard... and here's an Oscar number just to confuse matters. Now two names (or three even) ... instead of one, so we all have to cross-reference simple names, to enjoy the downlink-only 'educational' telemetry.

But of course, the damage has already been done. We can't go backwards. The movers and shakers sold the show a long time ago. I can personally remember being told at the Univ. of Surrey Colloquium many years ago that AMSAT *had* to get involved with the education sector or there would be no future for the organisation. So, they did, and we are here today.

Clocks only go forwards (unless you are Doctor Who). Too late now. It's done. The best we can do is get used to it, just like PLT and other radio-intrusive things on the ground. As for IARU co-ordination... nice idea, but completely un-enforceable. Like it or not, YUBILEINY-2 is on it's way, perhaps this year.

On a positive note now. We may have the Chinese XW-1 to cheer us up a little at Christmas. I'm told it can even transpond. At least it may cheer up LA2QAA! Could even make me happier.

http://www.southgatearc.org/news/december2009/xw1_new_website.htm

Have a good holiday everyone.

2998. XW-1 Merry Christmas !!!.

Yahoo group: eu-amsat
Date: 2009-12-15 09:54:10 UTC
From: John Hackett
Topic: 2998 Message: 2998

Group,
China's 1st ever amateur radio satelite XW-1 is in space now!

AMSAT China reports it was launched at about around 0230 UTC on
December 15, 2009. The beacon was received in Sanya after launch.

XW-1 was a secondary payload aboard the CZ-4C rocket from Taiyuan
Satellite Launch Center into a sun-synchronous orbit about 1200
kilometers high. The primary payload of this launch is the Yaogen-8
Remote Sensing Satellite.

The preliminary keplerian elements for the satellite are:

XW-1
1 99999U 09349.11987269 .00000000 00000-0 00000-0 0 00006
2 99999 100.4859 046.2958 0001760 147.4703 038.6343 13.15267150000017

The XW-1 communications payload includes a beacon and three cross
band transponders operating in FM, linear, and digital modes.
Here is a Spacecraft Summary:

Common Name: XW-1
Alternate Name: CAS-1
Satellite Type: Microsatellite
Launch Date: TBD
Launch Location: Taiyuan Satellite Launch Center of China
Launch Vehicle: CZ-2C(LM-2C) Rocket
Apogee: 1200km
Perigee: 1200km
Inclination: 105 degrees
Period: 109 minutes
Local time of descending node: 21:30
Weight: 50kg

Frequency Information

Mode V/U (J) FM Voice Repeater (30 dbm (1 w)):
Uplink: 145.8250 MHz FM, PL 67.0 Hz.
Downlink: 435.6750 MHz FM

Mode V/U (J) Linear Transponder (Inverting) (30 dbm (1 w)):
Uplink:145.9250 - 145.9750 MHz SSB/CW
Downlink:435.7650 - 435.7150 MHz SSB/CW

Mode V/U (J) PacSat BBS (30 dbm (1 w)):
Uplink:145.8250 MHz AFSK 1200 BPS
Downlink: 435.6750 MHz AFSK 1200 BPS

Mode Beacon (23 dbm (200mw)):
Downlink:435.7900 MHz CW

You can get XW-1 Telemetry Format at
http://www.amsat.org/amsat-new/satellites/documents/XW-1_Telemetry_Format.pdf

Details of the XW-1 satellite are available at:
http://www.camsat.cn/index.php?option=com_content&view=article&id=56&Itemid=67

[ANS thanks David Chen, BD5RV/4 and Alan Kung, BA1DU for the above information]

Hello, John.
Good news! Thanks for prompt information.
Several moths ago I stopped my satellite operation via FM repeaters in
the space by the reasons, which were discussed on this forum a lot.
This new linear transponder, probably, will help to restore
my interest to satellite communications.
Let's to wish him good health and long life.

Ah Danke Mike

Anyway, I will observe today launched satellites for intruding
with DOKA-B. Only if we report such satellites, we get a very
little chance for a change. But if we accept it when they have
a CW-beacon, then we have lost our frequencies.

Could be the SC polar orbiting sat? He was supposed to be launch around December 24 UTC (23 EDT)? i just remember to have read something on
the Kodiak launch site about a LEO sat but Google still return nothing.

Anyone having more details on this new sat launch will be welcome my google search does not report anything useful yet.

Nader,

There are many USB to Serial converters which do not work with Ham Radio applications. Try using the device with a powered USB hub or look out of USB to serial converters with the FTDI chipset which works great.

It is quite a nice christmas gift for the amateur satellite community who was offered by China. XW-1 will make possible transatlantic
contacts when he will be over central atlantic ocean. In North America the following grids will be in range for EU contacts: FM 27-28 FN
04-05-10-12. In my grid FN36 i will have a 5 deg elevation at max and it will be lower for the grids i mentioned.

Congratulations Alan and for all of your team. You are the proof that our amateur satellite future will be more and more internationally
driven XW-1 and SO-67 and all the other project in the making is and will only lead and guided the next satellite builders to redefined
their next steps.

Is a new HEO capabilities can emerge? i believe yes and it will probably come from unexpected new launchers sources.

The global world warming effect and the greenhouse gas effect will need new measurement tools. A strong pressure will be put on ways to
measure those greenhouse gas and satellite will be the ultimate tool. It is a new potential where amateur radio satellite builders can
exploit? At our local level here we use the emergency communication argument, with this global warming potential disastrous consequences at
an international scale the amateur radio community will have to shift the usual emergency communication focus towards emergency global
warming communications.

Satellite monitoring and international greenhouse gas space watch will represent a lot of new openings. The amateur radio satellite world-
wide network is able to handle a lot of data downlinks, data who can be transferred through internet at any point on the earth. APRS and
DPRS is already monitoring and sending weather reports from all over the world is a pollution index can also be transmitted aside of all
the other weather data parameters? What about a PC screen showing the global pollutants evolution on a day by day basis live data coming
and relayed by amateur radio satellite. The possibilities are endless will we be able to positioned ourselves accordingly???

Some will say it is fiction but what's it's call fiction today often became tomorrow reality.

From: st2nh
Topic: 3014 Message: 3014

Hi Gentelmen

Now I finished fixing my antennas on the roof at height about 13 meters from ground!! .The only possible distance to root the coax down to the shack is about 25 Meters (sadly)!!!

I got a new 9913 and I have preamps for uhf &vhf (advanced receiver research preamps). Coax 9913 Attenuation (dB per 100 feet) is 1.4 at vhf and 2.8 at uhf.

25 meter = 82 feet.

So gentlemen any clue or previous experience with same coax length?? .

Hi Nader.

In any satellite receieve system it pays to place the preamp at the antenna. Your receive system should be as good as your circumstances permit. Your TX system is not so important and the losses are tolerable.
My reasoning is that if you do it the other way, with preamps at the shack, you add the noise generated by the co-ax to that of the wanted signal, which of course would be undesirable.

1.4/2.8Db is not a massive loss, but with weak-signal modes including satellites and EME, every little helps. With FM birds you probably wouldn't notice a difference, but try it on AO7 and you probably would! So, if you can, and it is not a huge inconvenience, I'd suggest placing the preamps at the antenna end.

Have a good Holiday.

73 Al.
PS... you might want to talk to LA2QAA who knows a lot more than I do about antenna systems, and used to do antennas for rather more important work.

Nader,
-1Db at VHF, unless you have exceptionally sensitive ears you won't even notice any change.

At UHF, 3Db it's noticable but *NOT* a problem.

In your case the preamps - (at the aerials, of course !!!!) - are going to give you quite a large 'positive' power budget.

Nice set-up, most people would be envious.

>
>

Hi Luc and the group.

We only get to use the 70Cms band as 'secondary status' which means that the primary users get priority and can demand that we don't cause interference to them. Not a lot we can do about that I'm afraid.

Although the military are the primary users, I believe their main use of 70Cms is for RADARS and ranging systems, but I can't say that I have ever really noticed their presence, except for what I believe to be de-sense of oscar7 while the bird is/was approaching the UK.

RAF Fylingdales in Yorkshire UK operates a large and very powerful BMEWS RADAR on 70Cms which has been implicated in the past for de-sensing amateur satellite 70CMs uplinks when birds are within range, but thats not seen as a major issue really. 70Cms is 'inhabited' by all manner of license-exempt equipment which I see as a bigger threat. My remote conrolled electrical sockets for instance run on 433.920Mhz, a very popular choice for these things. There are also millions of car keys (radio type- rolling code devices) and a million and one other 'license exempt' low-power devices opoerating on 70Cms.

Fylingdales.
http://www.ofcom.org.uk/radiocomms/spectrumawards/completedawards/award_412/qas/#5

http://www.observations.biz/Joint_Observations/BMEWS_ed.htm

http://en.wikipedia.org/wiki/RAF_Fylingdales

If you are interested, there is plenty of material. Google is your buddy.

Fylingdales is only one of several Ballistic Missile Easlr Warning RADARS around the world operating in the 70Cms band.

See...
http://en.wikipedia.org/wiki/Ballistic_Missile_Early_Warning_System

Plenty of 'ammo' for Luc.

In the UK, there are 'restricted zones' in a few areas where 70Cms operation is not permitted. I'm sure the same is true elsewhere.

So as far as 70Cms goes (along with 2.4Ghz), we are very much the poor cousins. Actually, we are lucky to be able to use both bands at all.

2.4GHz of course is an 'unprotected' ISM (Industrial Scientific and Medical) band, and like on 70CMs, we have to accept intereference from primary users. In most urban areas, 2.4GHz is a very busy place!
Next time you pop your TV dinner in the microwave, just think 2450MHz (hopefully).... if your magnetron hasn't drifted. Almost every microwave oven on the planet operates on 2.4G's!

There are many industrial devices on 2.4 (some running kilowatts) along with countless millions of Wireless Access Points (WAPs) for Internet use. Mine sits about 5 feet from where I'm writing this! I believe the maximum power allowed for these devices in the UK is around 0.5watts, although mine ruuns 15mw.

Lets face it, 70CMs and 2.4GHz are hardly ideal for weak signal use.

John K8YSE wrote: It could have been that the BBS stops the voice repeater but there were times that VE2DWE was making it (although noisy) and my signal was not there at all. Maybe the amount of deviation on the tone makes a difference when there are a lot of competing signals on the input.

As the bird sank low on the horizon on the way north, it was again possible to get into it. Normally there are not many who get into any satellite that is in northern Canada. Less congestion on the input gives you a better chance.

> I heard Drew mention that perhaps due to the PL tone and the large number of stations trying to use the repeater, very few stations were able to make a QSO.
>
>

Three problems: as with AO-51 the CTCSS tone is blocking a lot of station it was the same when ISS cross band repeater was on too. When XW-1 was over central USA his footprint was covering nearly all the Northern continent including central america and the Carribean island with all the Northern satellite station in the same footprint it should be a challenge at the satellite receiver to have one station able to make it through that's the second one and for the third one the packet BBS also is competing at the receiver and i'm guessing at the transceiver too as i never heard the packet transmission over a phone transmission. Without any knowledge of the ways the transmitter is voting or who's got the priority first it is hard to tell if this packet turn over is not also a contributing factor as many of my transmissions where shut down to just get a packet burst afterwards?

I missed the linear transponder but i'm guessing it will be "The mode" on XW-1 as per what i heard from the recordings.

It is a great sat and as i wrote a nice christmas gift with SO-67 as a suggestion the FM/BBS mode can be put in service in light traffic pass as it is permitting less traffic than the linear transponder, but it can be an

alternance of both. Let see what the european pass will
give as the whole europe will be in the same footprint!!!.

For the magic in my antennas there is none that i know but operating in full duplex is a big help as you can choose when to key the TX but
as we cannot get a constant TX from the satellite we probably often transmit over each other Letting the receiver only activated by the
carrier will at least make us hear through the capture effect and it will tell us when it's time to TX? It will not solved the tailgating
problem but it will help.

P.S. There is also a trick on XW-1 as there was one on SO-67 i will have to check it again but he's not much nicer than the one i discover
on SO-67 fighting against the 3 seconds timer... Just remember i wrote "fighting"!

Hi ALL
Gentelmen Al , John

Thanks for advice and reply.

YES Im back on sat.
Coax length is 30 meters now !!

But my home-brew antennas are really supper .

Switchable Circular polarazation is really fantastic tool :-)
Do not belive otherwise ,, even for LEO sat!!

I havn't touch my PREAMP even with long coax.!
QSB!!! just toggle the polaraztion swith and you wll be back.

I hworked before with simple home-brew Yagi (6 horizantal
elemements for VHF and 12 vertical elements for UHF on same boom.

Now I re-used my old switchable circular polaration antennas
6x6 elements for VHF.
12x12 elements for UHF
On each antennas one set of the elements displaced 1/4 wavelength on the boom with phasing line and a relay built in side the boom.

http://www.st2nh.com/myequipments

On first OHLLAA QRM test, I worked 3 Europen sations

Notice the Rotor now is G-5500 :-)

Also I have antennas for L and S band .!
but no activity now to load my rotor Gear.

Hope to catch you once again on new Birds

73 from hot Africa (28 c under the AC)

Alan,
On behalf of the EU-Amsat group I cordially invite you and all members of CAMSAT to join us.

We have members on all continents.

Membership is entirely FREE and is open to all amateur radio satellite operators - or those wishing to join us.

You can find us at ... <http://groups.yahoo.com/group/eu-amsat/>

Please distribute this information to the members of CAMSAT.

Let me also take this opportunity of congratulating you on XIWANG-1 (HOPE-1).

All modes tested in only 6 days after reaching orbit.

Very impressive indeed !!! Alan.

On behalf of the entire EU->Amsat group.

Congratulations and THANK YOU.

I don't want to be a trouble maker but did you ever think your A148-3S was developing some issues with the years? I will pay your S&H in
full just shipped your A148-3S to me and i will even add 25$ to pay the hardware used to build your new tape measure antenna.

Plus a bonus donation of 10$ to AMSAT-NA. (no string attached)

Hello Folks,
Thought for the day.

QUESTION:

What do CAS-1, HOPE-1, XIYANG-1, XW-1 and HO-68 all have in common?.

ANSWER.

They're the same satellite.

Please draw your own conclusions.

73 John. <la2qaa@amsat.org>

Hello John

I guess XW is the short form of XiWang and Xiwang means Hope. But
CAS-1 doesn't exist. I only found a satellite CAS-A, launched 1971.

Merry Christmas, 73

Thomas,
Cas-1 was what the Chinese themselves were calling XW-1 on their
BT3WX special station website. it was also referred to in a couple of other instances.

It doesn't matter because the satellite will undoubtedly become commonly known as HO-68.

I am aware that somebody corrected Amsat's designation of XW to XIWANG meaning HOPE ...
(GM1SXX told me this 3 days ago).

The point of my e-mail was to illustrate that several names for the same satellite can be rather confusing to the potential newcomer.

Ah yes John. This was the old name of the project. The name was changed
a long time ago.

I think this was an exception for a Chinese satellite. Anyway, that's not
so important. Now its Hope-OSCAR-68 or HO-68, two designations more to
think about, hi.

Hi all

I've Just read the schedule and synchronize my PC time!!!
And YES at 19:45 I hear my echo back from the sat.
Wounderful so strong and clear and with 5 watts (yes 5 watts only)
I worked DL8DR-ON5UE-F6HTJ-SQ7DQX .

ALL what I can say THANK AMSAT-CHAIN
THANKS Alan FB OM

And tnx for every one sharing me fun

Hello Nader and group

Its not possible to have a HEO in orbit next year, just more CubeSats.
In the next time I will look through our new German journal again and
compile news about P3E.

Merry Christmas and a happy and healthy New Year to you All.

Group,
Great !!! Christmas pressie wot?, chaps ...

Ho Ho Ho-68.

I havn't bothered to switch on a rig just yet- but I will put in an appearance CWFPQRP when things settle down a bit.

(CWFPQRP = CW, feet portable, QRP)

HI John & All

It's a Xpoder !!there a room for QRP
The fun is now ..!
I worked yesterday 3 continents in one pass!!
Africa, Asia and Europe

Excellent! Nader,
IOTA EU-36 is my home QTH so I sometimes get a reply now and again.

I'm a bit too far north for the ISS but I can see HO-68 between the mountains for about 5 minutes when it's east of my new QTH.

I wasn't allowed to have my satellite array at this new flat so I'll only be operating portable most of the time - though I 'do' have a 70cm beam disuised as an old fashioned 'TV' aerial for when the neighbopurs are asleep - hi-hi.

I'm still using 22 year old rigs so the auto-doppler tracking is a bit of everything.

It keeps both hands busy on CW - it keeps me out of trouble !! ... he he he.

Let me take this opportunity of wishing you a HAPPY NEW YEAR Nader.

3040. First QSO'S on HO-68 linear Xponder

Yahoo group: eu-amsat
Date: 2009-12-29 02:22:04 UTC
From: Luc Leblanc
Topic: 3040 Message: 3040

Just got my first few QSO'S on the linear transponder of HO-68. It was like a small motel room with all efficiencies but walls are in
cardbox and you can hear the 3 rooms on each side. But what an excellent signal and audio was Q5 on any station i was able to hear. It was
like 20 meter band on a contest day...

Recommendation just tune the higher frequency (The downlink). Messing with the uplink just not work as you step over a lot of stations. It
is by far the strongest linear satellite and i will try auto doppler on the next linear session. I count about 15 simultaneous station at
the same time and the dowlink power was holding even with some excessive uplink power at times! It is understandable as the new toy was
just getting out of the box...

As the power budget is higher the transponder is able to give enough signal to a lot more stations. The key is high downlink power to be
able to sustain more station at the same time. But just try to reduce your power when the satellite is overhead he's just above you at TCA

3041. Endorsement.

Yahoo group: eu-amsat
Date: 2009-12-29 09:46:54 UTC
From: John Hackett
Topic: 3040 Message: 3041

Group,
I absolutely endorse both of Luc's points.

>Recommendation just tune the higher frequency (The downlink).
>Messing
with the uplink just not work as you step over a lot of stations.

Remember !!!, as yet, the satellite has many! newcomers and they *DON'T* !!! all
have auto doppler tuning radios.

Power.

We now have a linear transponder that is 'controllable' again. Lets not hit it with more
power than necessary and shorten it's life by idiotic operating proceedures. Like Luc
says - and has been on 'OBSERVATIONS' for Donkey's years ... turn your4 power down
at TCA.
.....
.....

For those that can't be bothered to nread OBSERVATIONS.

POWER. How much is enough?
LA2QAA Feb 2006

There could be many answers to that question but the correct one regarding
amateur satellite communications is:

"Just enough to maintain effective
communications".

For instance, how many people reduce their power as the satellite
they're operating on approches TCA (time of closest approach). A good operator
will, because they know that the use of excessive power is *not* good for the
transponder. Case in point. When AO-7 first comes up over the horizon you'll
probably need "X" amount of power to communicate effectively.

However, after 10-15 minutes, as the range decreases you'll find that a 3dB
(50%) reduction of power will have no effect whatsoever on the signal. A *VERY*
sensitive S-meter might show a difference but your ears certainly won't. Hands
up those that actually regulate their power to maintain effective
communications. (No, I didn't think so). You should try it sometime, you might
get a surprise.

By the way, we do know (don't we?) why most satellites have a beacon?.
The principal reason for a beacon is so that you can regulate your power to be
consistent with that beacon, it's your reference. No signal should ever be more
powerful than the beacon. That's what it's there for. Naturally, it will also
serve as your propagation reference.

3042. AO-68 schedule

Yahoo group: eu-amsat
Date: 2009-12-29 10:02:50 UTC
From: John Hackett
Topic: 3042 Message: 3042

By curtesy of Alan BA1DU, here is the HO-68 schedule for December the 27th 2009 to January the 3rd 2010.

27 Dec. 2009
HO-68 Linear Tansponder
Turn On:
20:20...South Africa
20:30...Europe,North Africa
20:40...Europe,North America, North Africa,North Pole
20:50...North America, Europe,North Pole
20:55...Turn Off

==========
28 Dec. 2009
HO-68 Linear Tansponder
Turn On:
01:40...South America
01:55...North South America,South NA
02:10...North America
02:15...North NA,Russia,North Pole
02:20...Turn Off

28 Dec. 2009
HO-68 Linear Tansponder
Turn On:
12:31...South Australia,South Pole
12:35...Australia,South Pole
12:41...Turn Off

28 Dec. 2009
HO-68 FM and Digital Transponder
Turn On:
12:51...South Asia, North Australia
12:55...East Asia, South Asia
13:05...East Asia, North Asia, Middle Asia
13:06...Turn Off

28 Dec. 2009
HO-68 Linear Tansponder
Turn On:
21:45...South Africa
21:55...South America,West Africa
22:05...West Europe, West North Africa
22:15...North America, Europe,North Pole
22:20...North America, North Europe, North Asia,North Pole
22:25...Turn Off

==========
29 Dec. 2009
HO-68 Linear Tansponder
Turn On:
01:20...South America
01:35...North South America,South NA
01:50...North America,North Pole
01:55...North NA,Russia,North Pole
02:00...Turn Off

29 Dec. 2009
HO-68 Linear Tansponder
Turn On:
12:13...South Australia,South Pole
12:20...Australia
12:25...Australia,South Asia
12:29...Turn Off

29 Dec. 2009
HO-68 Linear Tansponder
Turn On:
12:34...South Asia,East Asia,North Australia
12:40...East Asia, South Asia
12:45...East Asia, East North Asia
12:50...Turn Off

29 Dec. 2009
HO-68 FM and Digital Transponder
Turn On:
16:05...Middle East Asia, South Asia
16:20...South Europe,Middle East Asia
16:30...Europe,Middle East Asia
16:35...North America, North Europe,North Asia,North Pole
16:40...Turn Off

29 Dec. 2009
HO-68 FM and Digital Transponder
Turn On:
18:00...East Africa,Middle East Asia
18:10...Europe,North Africa,Middle East Asia
18:20...Europe,North America,North Pole
18:30...North America, North Europe,North Pole
18:40...North America,North Pole
18:45...Turn Off

29 Dec. 2009
HO-68 FM and Digital Transponder
Turn On:
21:40...Wset Africa
21:50...Wset Europe,North Africa
22:00...Europe,North America, North Pole
22:05...North America, North Europe,North Asia,North Pole

22:10...Turn Off

From: Thomas Frey
Topic: 3042 Message: 3043

Hello John and group

As CWist you can also to hear the schedule via morse beacon on 435.790 MHz.
This looks like as follows:

```
Call ID ID Ch1 Ch2
-------------------
BJ1SA XW XW AAA TTT -> only Beacon
BJ1SA XW XW TTT TTA -> Beacon + Linear transponder
BJ1SA XW XW TTT TAT -> Beacon + FM-Repeater
BJ1SA XW XW TTT ATT -> Beacon + software upload (maintenance)
```

I listen with my old PK-232.

3044. CW beacon

Yahoo group: eu-amsat
Date: 2009-12-29 13:15:37 UTC
From: John Hackett
Topic: 3042 Message: 3044

Hello Thomas!,
That was very interesting, I didn't know that.

Even though I'm a 'linear' enthusiast and CW man I havn't bothered to work
HO-68 yet, in fact, I havn't even listened.

I've been waiting for things to settle down as well as working on an auto-doppler
tuning system for older rigs that don't have CAT interfaces.

I still use my trusty old FT-290 on VHF with a home brew 25w linear.
The auto-rotor for the 70cm downlink is also homebrew. The downlink is to
a TR-851E which is also getting a bit long-in-the-tooth (old) now.

Thanks for the info Thomas and let me wish you A HAPPY NEW YEAR.

73 John. <la2qaa@...>

Subject: Re: [eu-amsat] AO-68 schedule

Hello John and group

As CWist you can also to hear the schedule via morse beacon on 435.790 MHz.

This looks like as follows:

Call ID ID Ch1 Ch2

BJ1SA XW XW AAA TTT -> only Beacon

BJ1SA XW XW TTT TTA -> Beacon + Linear transponder

BJ1SA XW XW TTT TAT -> Beacon + FM-Repeater

BJ1SA XW XW TTT ATT -> Beacon + software upload (maintenance)

I listen with my old PK-232.

3045. XW-1 BBS over Africa (1st time)

Yahoo group: eu-amsat
Date: 2009-12-29 21:04:32 UTC
From: st2nh
Topic: 3045 Message: 3045

Hi All and HNY

I h've succeded connect to the XW-1 BBS , Orbit # 192 ,18:05 UTC.
Wisp upload window pop-up 3 times !! But the FM voice was longer than the re-try time!!

For sure I wll upload my messages soon on XW-1 BBS .This is really fun.

Thanks again Alan Kung and XW-1 team for the new schedule and for the Multi Mode New Year Gift . :)

Newcomers,

George KA3HSW is (thankfully) repeating what GM1SXX and LA2QAA have been saying for many years now ... see <http://www.observations.biz> ... however, it deserves yet another airing ... go ahead George ...
.....

With your 2-radio setup, you should definitely leave your uplink frequency fixed, and tune only the downlink. Unless you have full computer control for doppler, this is the "One True Rule" anyway: tune only the higher of the two frequencies, where the doppler shift is greatest (about 9 kHz at 435). (If you ever get on VO-52, note that it has a VHF downlink and a UHF uplink, so you would tune the uplink there instead.)

Remember that the transponder is INVERTING: you must uplink on LSB, and listen to the downlink on USB. Also, the higher your downlink frequency is in the passband, the LOWER your uplink frequency will be. CW is generally found in the lower half of the passband (435.715 - 435.740) and voice in the upper half (435.740 - 435.765). Therefore, you should pick a downlink frequency above .740, and set your uplink radio to the corresponding frequency (the same amount DOWN from 145.950, the center of the uplink passband, as your downlink frequency is ABOVE 435.740, ie, an uplink of 145.940 for a downlink of 435.750) Pick a clear frequency, but don't go too high up, as most voice activity tends to stay pretty close to the center. For convenience, you might want to make up a little nomograph or chart that has the downlink frequencies on one line/column, and their corresponding uplink frequencies on another.

As far as power goes, the general rule has always been that your downlink should be no stronger than the beacon. That way, you're not tripping the AGC & knocking down someone else's signal. The FCC rule is, the minimum power necessary. Others have reported that 5 watts to an Arrow is sufficient.

Transmit either a slow voice count or a string of CW dits or V's while tuning your receiver around the predicted downlink frequency until you hear yourself. Early in a pass, while the bird is coming toward you, it'll be higher, and drift downward as the pass progresses. Call CQ, and listen for someone coming back. They probably won't be right on your downlink frequency, as doppler shift will be different at their location than at yours, so you'll have to tune your downlink to them. Hopefully, they will tune theirs to match yours. You'll get the hang of it pretty quickly.

Good luck, & hope to hear you on the birds!

George, KA3HSW
.....
.....

3048. New Year's resolution

Yahoo group: eu-amsat
Date: 2009-12-30 10:35:43 UTC
From: Luc Leblanc
Topic: 3048 Message: 3048

From the web and me

At this decade end New Year's resolution is a commitment that an individual makes to a project or the reforming of a habit, often a
lifestyle change that is generally interpreted as advantageous. The name comes from the fact that these commitments normally go into effect
on New Year's Day.

What i wished you in 2010 is to show more tolerance of others. We came from a long way back from 2000 especially on AMSAT-BB. Just read the
archives but there is still progress to accomplish. If tolerance can be the path to human reconciliation here it will not hurt to expand it
out of here...

As written on this BB:

>> ... I don't want to be a troublemaker ... ME!

Since when, Luc? Is this a New Years' resolution of some sort?

If tolerance of others is interpreted as a way to make trouble i guess yes but if my opinions can make only one think just ounce
differently about issues and amateur radio satellite future i already fulfil my resolution.

In the mean time I wish you Health and may this New Year bring newly found prosperity, love, happiness and delight in your life.

Here is some text who i hope can be of some help to us all.

Criticism is the judgment (using analysis and evaluation) of the merits and faults of the actions or work of another individual. Criticism
can mean merely to evaluate without necessarily finding fault; however, usually the word implies the expression of disapproval.

Vulnerability with their own self-esteem makes individuals with narcissistic personality disorder very sensitive to criticism or defeat.
Although they may not show it outwardly, criticism may haunt them and leave them feeling humiliated, degraded, hollow, and empty. They may
react with disdain, narcissistic rage, or defiant counterattack.

Narcissists are extremely sensitive to personal criticism and extremely critical of other people. They think that they must be seen as
perfect or superior or infallible or else they are worthless. There's no middle ground

The narcissist is constantly on the lookout for slights. He is hypervigilant. He perceives every disagreement as criticism and every
critical remark as complete and humiliating rejection: nothing short of a threat.

Criticism and paranoids

Individuals with paranoid personality disorder are often rigid, critical of others, although they have great difficulty accepting criticism themselves.

Criticism and avoidants

Individuals with avoidant personality disorder are hypersensitive to criticism or rejection. They build up a defensive shell.

Hi Thomas & Group

As stats on XW-1 Store-forward Transponder User's Manual
(PL 67Hz tone must be turned off.)

Hope a good luck with BBS OM Thomas .

Hello All

This "rules" never works in the practice. OPs have different meanings,
rigs and software. If you want a rule, then the "fixed downlink rule"
is the best: tune only the uplink and let the downlink be fixed. I
can not see any disadvantage with this rule.

> 145.940 for a downlink of 435.750)

Correct and fully agreed. BUT when you tune the downlink and not the
uplink, you moves downward (eventually) into other QSO's and below the
center and into the lower half of the passband.

> Pick a clear frequency, but don't go too

OK, with full CAT no problem.

>

> sufficient.

OK, on AO-10 and AO-13 it was the rule to not produce a downlink
signal stronger than the beacon signal. On AO-7 we have no beacon
but on VO-52 and HO-68. The Phase-3 transponders are different to
them on OSCAR's 52 & 68. General rules are not needed, if every
OM operates with sanity.

If both OM's tune their uplink to the same downlink QRG, they
will never have a doppler problem.

> Hopefully, they will
> tune theirs to match yours.

Yes, tune uplink to match the downlink.

3052. Re: doppler conventions.

Yahoo group: eu-amsat
Date: 2009-12-30 21:03:53 UTC
From: John Hackett
Topic: 3047 Message: 3052

Hello Thomas,
Obviously, the *One True Rule* by KB5MU of tuning for a fixed frequency at the SATELLITE is the correct one ...

<http://www.amsat.org/amsat/features/one_true_rule.html>

However, this is based on the fact that everybody has an auto-doppler tuning rig with appropriate software ... WHICH IS NOT THE CASE IN THE REAL WORLD.

About 15 years ago, I wrote in an Amsat-UK publication that there were TWO (2) conventions for doppler tuning ... actually, there were more but mainly t5hey were split between the 'American* version and the *European' version. The Satellite Handbook' (American) endorsed one and Commander John Brannegan's book (GM4IHJ) endorsed the other.

Personally, I'm in the category of not *USING* 'automatic' doppler tuning (though I have homebrewed a system). I follow GM4IHJ's convention of tuning the higher frequency *REGARDLESS* of uplink or downlink - simply because of the FACT of the higher the frequency, the more the doppler deviation.

This is because I *DON'T* have an automatic doppler tuning rig ... like *VERY* many other operators.

Everybody is entitled to his or her opinion and will probably still be debated in the next decade.

The above is my personal opinion and I have noted 'why' it is so.

> uplink, so you would tune the uplink there instead.)

Hello All

This "rules" never works in the practice. OPs have different meanings,

rigs and software. If you want a rule, then the "fixed downlink rule"

is the best: tune only the uplink and let the downlink be fixed. I

can not see any disadvantage with this rule.

Hello Luc,

It was me, at least I gave you 59 signal report and my locator :)
Heard my own signal clear at the downlink at the time I answered to you call.
If you didn't copy my call correctly I presume we didn't have "2-way" contact, but we can try to complete the QSO some other day.

Thank's Mika i will not push it to this extent it's too far from your real call sign and i was fiddling with the knobs and elevation
actuator just at 3 degrees at AOS. Next time i will put my recorder on...HI and yes the 59 signal report stands

Happy New Year

Vk4tex de La2qaa,
I've forwarded your comment to the EU-Amsat group where the
comment on your log originated.

As the ex: moderator of the AO-7 Resource page it was my experience that
at least 40% of AMATEUR operators just clicked anyway - mistakes and all - and
made a pigs arse out of the log - the data, then, over time, became practically useless for
it's intended purpose and instead became a 'points' table ... which it still is.

(which is also the reason I threw in the towel).

(I tried to make people aware of the above fact, to no avail) ... even to the extent of
a 'corrections' request list - (I could of course edit each individual entry) - but it
became
too sloppy in the end, so I gave up.

```

I ask a question on my personal web page to Gunther. I don't know if the AMSAT-NA censorship office will let this one pass? But in any case i crossed posted this one on "eu-amsat@yahoogroups.com" Apparently the last free amateur radio bulletin board on the internet correct me if i'm wrong?

If AMSAT-BOD mixed 2009-2010 mixture and his afterburner gas AMSAT-BB defenders seems to not having taken any New Years' resolution of some sort, has suggested by George Henry. I renew all my 2009 resolution and i will put all my censored post on AMSAT-BB on my Web Page in 2010 even if they are actually cross posted at 99.99% on eu-amsat@yahoogroups.com.

As per previous declaration made by Gunther Meisse just after i pointed out "MAJOR" issues in the AMSAT-NA financial statement it seems his biggest "innovative accounting procedures" called "the voluntary reporting system to document the value of AMSAT volunteer hours" as an asset element... in the financial statement was probably inspired by the "commercial paper/sub prime" fashion.

It is not something who should appear in any financial statement and if it appears it should only be a footnote used by the BOD for some
sort of administrative measuring tool. Never ever to be used to artificially boost the revenue or asset column.

My little finger told me it is this very stupid accounting procedures who spring it back in his face actually and Gunther will surely
correct us all at the same time he will answer us all how much of his goals he achieved in his June 25 2003 letter. See my web page on

I should probably not give you the patronizing definition but just in case it will be applicable here it is: patronizing - (used of
behaviour or attitude) characteristic of those who treat others with condescension.

I don't know if you take some New Year's resolutions but i can tell you one i just renew " I remember" and here is a link who will help
you to understand licence plate...

http://www.onf-nfb.gc.ca/eng/collection/film/?id=51059

In the mean time just read back my previous message and checked if it appears on AMSAT-BB and feel fre to give me your sound advice.

Group,

Luc said ...

>I crossed posted this one on "eu-amsat@yahoogroups.com" Apparently the last free >amateur radio bulletin board on the internet correct me if I'm wrong?.

The 'VERY' reason this group came about was for a forum *WITHOUT* censorship when amateur satellite operators could express their personal opinion *WITHOUT* being censored, flamed, ridiculed, criticised or otherwise demeaned.

All we ask is a small sense of decorum, common sense, no discrimination and no foul language.

This group *IS* moderted but I am extreemly proud of the fact that we have *NEVER* (so far) needed to exclude anyone for any or all of the above reasons.

That is a compliment to each and every valued member of this group.

Just so you know ...

From: John Hackett
Topic: 3071 Message: 3071

Thomas,
As a matter of interest ...

I too have been on occasion censored on the Amsat-bb.

On at least two occasions where (in my honest opinion) I have offered constructive criticism about the Amsat-NA webpage being out of date - my mails have *NOT* appeared on ther bulletin board - my intention was to merely make the person concerned aware of the proplem - however I *DID* recieved a rather unpolite e- mail off list mail from Andrew Glasbrenner informing me that (quote) "I have contributed nothing! to Amsat and *ONLY* criticise and complain" (End of quote).

(I have in fact contributed quite a lot over the years).

Just last week an HA station did the same and was publicly "hung out to dry" by the same person.

Naturally, I have no wish to me part of a group with leaders that have the attitude of ... "Follow the 'party line' or keep quiet" ...

They'll miss me about just as much as I'll miss them.

Oh yes ... the other mail that just happened to *disappear* was one where I'd commented that IN MY PERSONAL OPINION Amsat were shooting themselves in the foot by getting into bed with the universities - (under the banner of education).

Some personal opinions are *NOT* tolerated on the other side of the pond.

OK John, I take note of it. I have no experience with AMSAT-BB.
I'm subscribed in digest mode to read the stuff. Everyone is free
to unsubscribe if its mails are censored. I'm always cautious with
such reprovals. The most problems are housemade.

I'm glad to be a member of this group, in which I also can post my critical meanings. My compliment.

I fully agree with you Thomas as you seems to agree about AMSAT-BB censorship issues? It is also not a place to patronizing anyone as it
can be interpreted (probably wrongly) as personal attack too.

EU-AMSAT discussion forum was the best move made by a couple of dedicated people as L A 2 Q A A , John on Frei Island (IOTA EU-036), G M 1
S X X , Al in Scotland and the late S V 1 B S X , Mak in Athens
http://www.observations.biz/Observations_from_Greece/SV1BSX_Memorial.htm

If between the amateur radio worldwide family we cannot discuss freely how can we present ourselves as "Great communicator" when amateur
radio public bulletin board is censored? America (U.S.A) was not supposed to be the land of freedom and liberty but when we see it actually
the definition of liberty and freedom is interpreted not as the dictionary give but as anyone feel it should fit his own taste.

That's dangerous if you expand this trend a bit more you sow the seeds of intolerance making the intolerance growth soil fertile. And it is
a vicious circle.

Just hope EU-AMSAT will remain as i wrote: " Apparently the last free amateur radio bulletin board on the internet"

Moderating a bulletin board is not an easy task but it should not be a tool to disguised any form of censorship.

A last comment to John you refer to an individual and it is sad to often see highly technical folks lets called them technician became
intolerant and so closed minded up to a point to not been able of any rational judgement.

On the letters i put on my web page you will see this trend too and the human nature make's them regrouping and it is the actual core of
AMSAT-NA BOD and probably the same for some others AMSAT group too! (Just read the last letter last paragraph).

3077. Yubileiniy-1&2 , RS-38 and DOKA-B

Yahoo group: eu-amsat
Date: 2010-01-05 08:46:39 UTC
From: Al
Topic: 3077 Message: 3077

Hi Group.

This one is for John LA2QAA and Mike DK3WN... and anyone with an interest.

RS-38
I don't think Rs-38 exists. I think the RS-38 was a typo error since Yubileiniy-1 is the latest Radio-Sport bird and it is RS-30. Numberings are generally consecutive.

DOKA-B
Detailed information about the DOKA-B system does not seem to be available. I have only seen it mentioned in the manufacturer's website (Reshetnev) and also in the same site are a couple of drawings of the systems which include DOKA.

DOKA would appear to be both the command computer and telemetry downlink system.... in short... C&C.

DOKA-B is a 'command system' not an individual compoment. The signals from it are more broadband than we expect in the amateur satellite segment, being a type of FSK.

From AMSAT-NA (I suspect Reschetnev really!).....The spacecraft (Yubileiniy-1) central panel carries the DOKA-B equipment comprising the onboard computer; receiving equipment operating in 145 MHz band; transmitting equipment operating in 435 MHz

The Russians (Reshetnev) do publish information on their sute but they don't index it, so webspiders don't 'see' their information 'Dark Internet' ... non indexed. This makes finding information rather laborious :-)

Have a look at....
http://www.southgatearc.org/news/january2010/rs38.htm

Other sources say that Yubileiniy-2 launch has been delayed.I think this is more likely.

I think Mike and Nico seem to be the only people with a real interest in the mystery bird. See...
http://www.mail-archive.com/amsat-bb@.../msg06299.html

Yubileiniy-1.....
http://www.amsat.org/amsat-new/satellites/satInfo.php?satID=115&retURL=/satellites/status.php

Hi Al,

thank you very much for your response.

Meanwhile we had some off-list discussions with Nico PA0DLO, Andy G0SFJ and John LA2QAA as well.

The fact is that there is a satellite that transmits CW telemetry with RS 38. And the TLE belongs to Object #35869.

And it fits to a e-mail received last years from a russian contact of Andy:

> "our satellite called as RS-38 also

> Universitetskiy-Tatiana-2 was launched in 17 september 2009 in 19h

> 55min 12 sec DMT (Decret Moscow Time) from

> Baikonur cosmodrome launching pad N 31.

> All onboard systems are working in normal mode.

> Satellite is stabilisated and orientated properly.

> We are working ower it.

> Mass of the satellite 98,2 kg.

> Power of solar batterys 150 Watts, onboard voltage 27 Volts DC.

> Downlink central frequencies are 435.440 MHz and 435.490 MHz for

> onboard systems telemetry and 1.708 GHz for scientific telemetry also.

So there is quite a bit for it.. Maybe we'll get behind this puzzle.

Thanks and best 73,

Mike DK3WN

Hello Mike et all

Such discussions where very interesting in this group ...
Anyway, it was a theme here. After I heard UGATUSat with
DOKA-B last year I ask for observation in this group. But
no response.

> The fact is that there is a satellite that transmits CW telemetry with
> RS 38. And the TLE belongs to Object #35869.

From this satellite I heard only DOKA-B on 435.4905 FM yet.
I reported it last November. I observed the whole punch of
Russian satellites and all possible known frequencies.

The satellite has NORAD number 35869. If its name is UGATUSAT
or Tatiana-2 is not clear. Space-Track.org has it listed it as
UGATUSAT. Without any Russian infos or sources it is officially
UGATUSAT.

After the launch there was a great confusion with Mozhayets-4
on 435.352 MHz. The numbers may be IDs and has absolutely nothing
to do with the old Radio-Sputnik HAM-satellites! Its a shot in
our own foot, when we give those intruder satellites a Radio-Sputnik
designation! Please wake up! I only can repeat myself. This are
INTRUDER SATELLITES WITH DOKA-B which occupies our 435 MHz band.
The morse beacon is only an alibi.

Search also on
http://www.amsat-dl.org/index.php/satelliten-mainmenu-76/ersicht-aller-mainmenu-102
for "DOKA-Transponder". You can find there all satellites with a
DOKA-B transponder. In next future I will edit it to "DOKA-B-Transponder".

>The morse beacon is only an alibi.

While Al and myself have been repeating GM4IHJ Commander John Brannegan's sategen for over a decade now re 'intruders' and university 'me too' satellites, it must be remembered we only have access to the 70cm segement on a SECONDARY basis.

You can find the original satgen bulletins on Observations website.

Thomas,

Yes I agree - these RS-28, -30, -38 numbers are ID's.
These numbers will be given by the Russians themselves. I do not know what you mean by "Its a shot in our own foot, when we give those intruder satellites a Radio-Sputnik designation".

Why does a CW beacon should be an alibi? A CW beacon itself has nothing to do with ham radio.
It seems a non amateur radio satellite needs no IARU frequency coordination.
I am not sure if we are really the master of these frequencies...

73, Mike

After the launch there was a great confusion with Mozhayets-4 on 435.352 MHz. The numbers may be IDs and has absolutely nothing to do with the old Radio-Sputnik HAM-satellites! Its a shot in our own foot, when we give those intruder satellites a Radio-Sputnik designation! Please wake up! I only can repeat myself. This are INTRUDER SATELLITES WITH DOKA-B which occupies our 435 MHz band.
The morse beacon is only an alibi.

3082. OBS - not OBSERVATIONS ... it's an acronym for Old, Bald and Senile - aka LA2QAA.

Attachments: 3 described; binary payloads are missing from this source WARC

OBSERVATIONS FROM NORWAY. 0501101530Z

HOME MADE ROTOR.

The rotor is home made from an old rfotor that fell off the back of a passing lorry.
It's nfixed to an inverted clothes dryer 'whirly' with the nylon cord removed. The 'whirly'

holds an Arrow aerial.

The pics should be self explanatory.

The control box pic is made from an ice-cream carton - (wash carton first).

The 4 x BD135 transistors switch the rotor voltages while the 4 x BC547's switch the

UP, DOWN, LEFT and RIGHT LED's.

It's extreemly! important to have 'thousands' of flashing LED's in such a project so that

when it *DOESN'T* work - but thye LED's flash - the locals (yokels?) will be sauitably

impressed (de-pressed?).

To get the feedback system to work you'll need to go to the chemists and purchase a
box of prescription Albyl-E. Assuming you're not expecting a heart attack within the next

20 minutes, flush the tablets down the toilet and mount a 4.7K potentiometer on the cap

of the box and a suitable 3 pin connector on the other end.

You'll also need to 'borrow' a bit of elastic from your girfriend's knickers - or the leg
of a

pair of training trousers.

(See pic)

Using a 3 wire cord you can feed 5v to the potentiometer, then as the rotor turns, the

elestic will turn the pot feeding back a variable voltage between 0 and 5v, depending on

the azimuth position.

The elevation rotor feedback is the same, only this time the Albyl-E box and

potentiometer are hung on the end of a pendulum - so that when the aerial is elevated
the voltage on the elevation potentiometer changes - this is fed back to the rotor control

box (see pic) so the aerial "knows where it is".

Instructions for setting up the feedback system are in the NOVA TRACKING

PROGRAM help file.

The internet abounds with homebrew rotor control systems - this is mine.

Like I said - the pics ought to make it self explanatory.

If you don't have the 'exact' part ... (like I was taught in the Signals) ... IMPROVISE!.

You're an AMATEUR right? ... right !!.

I thought the band 435 - 438 MHz is exclusively allocated for
amateur-satellite
use from ITU? Is this wrong now? What I'm missing?

Thomas,
Uless there have been some governmental changes inj the last few days that I'm unaware of ... Radio amateurs are allowed to use the 70cm band on a SECONDARY basis.

That is to say ... government services 8primarily, the military, but others as well) have priority.

We only have EXCLUSIVE rights on 2m and a few higher microwave bands.

Packet
Radio 439.775 - 440.000 Digital communications (Note 6)
440.000

433 MHz Band Plan notes:

1. In Switzerland, Germany, Austria, repeater inputs are 430.600 - 431.825 MHz with 25 kHz spacing, and outputs are 438.200 - 439.425 MHz. In France and the Netherlands repeater inputs are 430.025 - 430.375 MHz with 25 kHz spacing and outputs are 431.625 - 431.975 MHz. In other European countries repeater inputs are 433.000 - 433.375 MHz with 25 kHz spacing and outputs are 434.600 - 434.975 MHz ie the reverse of the UK allocation
2. Emergancy communications priority
3. IARU Region 1 fax/afsk
4. Fast Scan Television carrier frequencies shall be chosen so as to avoid interference to other users, in particular the satellite service and repeater inputs. IARU Region 1 recommends that video carriers should be in the range 434.000 - 434.500MHz or 438.500 - 440.000MHz
5. IARU Region 1 packet radio
6. The DCC will recommend usage of this sub-band at a later date
7. Users must accept interferance from F/PA repeater outputs channels in 430.025 to 430.375MHz. Users with sites shich allow propagation to other countries (notable F and PA) must survey the proposed freequency before use to ensure that they will not cause interferance to users of those repeaters in those countries.

Hello Thomas,
I'm only certain that amateurs have been allowed to use the 70cm
band on a secondary basis since 1982, when I took the Ham license. For 16 years
pevious to that I was an army signaller and I do know the military had priority ...
but I can only be certain about Great Britain.

Whether other countries or the amateur satellite service was different in other places
I honestly couldn't say Thomas ... the USA and Britain are the same ... I'd be very
surprised if amateurs ever had exclusive rights anywhere other than 2m or sections of the
higher microwave bands - (mostly above 24Ghz).

I hope that helps Thomas.

3088. Primary or secondary status ?

Yahoo group: eu-amsat
Date: 2010-01-06 00:21:14 UTC
From: Thomas Frey
Topic: 3085 Message: 3088

Hello again

I remember me for other discussions about the status of the segment
435 - 438 MHz. I think in Germany it is primary (?). I found a document
on my drive from the Swiss government, edition 2009. In this the status
is defined as follows:
"435 - 438 MHz Amateur primary"
"435 - 438 MHz Amateur satellite secondary"

This is confusing but official.

I think its senseless if every country has its own definition of this
segment or subband. Its a point for discussion on a WARC meeting.

Hi Thomas,

This is certainly confusing.

I took the RAE Exam in the UK in 1985 and I can confirm that in 1985 the 70Cms band in Region 1 was allocated to radio amateurs on a secondary basis only. I still have the (UK) training material at home. 70Cms was my favourite band at the time.
The Primary user on 70CMs was (and still is) the military. In the UK, 70Cms is used for BMEWS RADARS (multi-megawatt) and other RADAR and Range Finding operation.
See my article BMEWS'ed... in Observations from Scotland.

23 &13Cms are likewise shared, and we are secondary users there also.
The 2M band is different... we DO have Primary status there, but no legal protection from interference.
I believe that 23&13Cms are both ISM bands in Region 1 (Industrial, Scientific and Medical) and amateur radio has secondary status. We share with Industrial users of RF heating (often tens of kilowatts) and of course leaky microwave ovens. This is the reality.

In many urban areas, 13Cms is chock full of signals we'd rather weren't there... but we have no protection from them, and no case to make against them. We are Secondary users.

Group members may find this snippet from IARU interesting..
http://www.iaru-r1.org/index.php?option=com_content&view=article&id=191&Itemid=144

The IARU website is really the correct place to check up on the rules regarding various bands in different regions. Books can and do become obsolete. Europe is in Region 1, so thats where we should be looking.... unless you are of course not in Europe... like some of our membership, in which case, your rules may vary.

This is certainly confusing.

I took the RAE Exam in the UK in 1985 and I can confirm that in 1985 the 70Cms band in Region 1 was allocated to radio amateurs on a secondary basis only. I still have the (UK) training material at home. 70Cms was my favourite band at the time.
The Primary user on 70CMs was (and still is) the military. In the UK, 70Cms is used for BMEWS RADARS (multi-megawatt) and other RADAR and Range Finding operation.
See my article BMEWS'ed... in Observations from Scotland.

23 &13Cms are likewise shared, and we are secondary users there also.
The 2M band is different... we DO have Primary status there, but no legal protection from interference.
I believe that 23&13Cms are both ISM bands in Region 1 (Industrial, Scientific and Medical) and amateur radio has secondary status. We share with Industrial users of RF heating (often tens of kilowatts) and of course leaky microwave ovens. This is the reality.

In many urban areas, 13Cms is chock full of signals we'd rather weren't there... but we have no protection from them, and no case to make against them. We are Secondary users.

ITU is also a good place, see
http://www.itu.int/ITU-R/space/support/ARS/Amateur-Satellite-Service-freq.pdf

I searched on http://www.itu.int/net/search/searchframe.aspx for "RR 5.282"
and following text appeard:

"Further, in accordance with RR 5.282 the amateur-satellite service may
operate in part of this band (435-438 MHz) subject to not causing harmful
interference to other services operating in accordance with the Radio
Regulations."

This also does not clearly state if the status is primary or secondary.
What do you think ? Is a specialist in our group ?

Personally, I would say the above text *DOES* imply quite clearly that amateurs may

use the 70cm band on a secondary basis ... though the word 'secondary' is not used, it *IS* implied and meant.

There is nothing to consider. Your question is already answered by the document. I believe the answer is very clear indeed.

> "Further, in accordance with RR 5.282 the amateur-satellite service may operate in part of this band (435-438 MHz) subject to not causing harmful interference to other services operating in accordance with the Radio Regulations."

How 'specialist' do you need? You have already provided the answer to your question.

The statement clearly means that amateur radio has secondary user status. The amateur-satellite service has secondary status, and IMHO always has done. The 'other services' noted in the document are primarily the military.

More on 70Cms interference to satellites by the military at..
www.observations.biz/Joint_Observations/BMEWS_ed.htm

More RADAR links..
http://en.wikipedia.org/wiki/RAF_Fylingdales
http://www.globalsecurity.org/space/facility/fylingdales.htm
http://en.wikipedia.org/wiki/PAVE_PAWS

These are some of the primary users in region 1.

PAVE PAWS RADARs have long been implicated in satellite de-sense issues. PAVE PAWS was mentioned *many* times in the past as causing problems to amateur radio sateliites by John Branegan GM4IHJ(SK) in his excellent SATGEN bulletins, where PAVE PAWS interference on 70Cms was well-documented. It was also documented by Don Moe DJ0HC/KE6MN in the past. There is a great deal of historical information available if you wish to do a little basic

research.

We are very much Secondary users in region 1. In all the time I have been interested in amateur radio,well before I obtained my license, amateur radio, amateur radio and the amateur satellite service has been listed as secondary on 70Cms.
National security comes before amateur radio. We are only small fish in a large pond.

Hello Al and John

Yes I see, I found my answer now. I was wrong informed about the status
of the satellite-segment.

In Germany they have their own laws. The Germans declared this segment as
primary and could shut down the 70cm downlink of Maroc-TUBSAT via
government.
This satellite was a joint venture between a University in Marocco and the
Technical University Berlin (TUB). This and discussions in the "AMSAT-DL
Forum"
a few years ago caused me to think the satellite-segment is primary.

OK, if the segment is secondary we also have no satellite intruders on
70cm. :-(

Thanks for this very interesting discussion. :-)

All,

A very interesting website with data and results from TATIANA-2 can be found on the Space monitoring data center website (Skobeltsyn Institute of Nuclear Physics / Moscow State University)

http://smdc.sinp.msu.ru/index.py?nav=tat2
<http://smdc.sinp.msu.ru/index.py?nav=tat2&switchdiv=SputnikMap>
&switchdiv=SputnikMap

You can also see that the Space Track UGATUSAT TLE matches to TATIANA-2 on their map. So there is definitely an swap of both TLE on Space Track.

Von: eu-amsat@yahoogroups.com [mailto:eu-amsat@yahoogroups.com] Im Auftrag von Al
Gesendet: Dienstag, 5. Januar 2010 09:47
An: eu-amsat@yahoogroups.com
Betreff: [eu-amsat] Yubileiniy-1&2 , RS-38 and DOKA-B

Hi Group.

This one is for John LA2QAA and Mike DK3WN... and anyone with an interest.

RS-38
I don't think Rs-38 exists. I think the RS-38 was a typo error since Yubileiniy-1 is the latest Radio-Sport bird and it is RS-30. Numberings are generally consecutive.

DOKA-B
Detailed information about the DOKA-B system does not seem to be available. I have only seen it mentioned in the manufacturer's website (Reshetnev) and also in the same site are a couple of drawings of the systems which include DOKA.

DOKA would appear to be both the command computer and telemetry downlink system.... in short... C&C.

DOKA-B is a 'command system' not an individual compoment. The signals from it are more broadband than we expect in the amateur satellite segment, being a type of FSK.

From AMSAT-NA (I suspect Reschetnev really!).....The spacecraft (Yubileiniy-1) central panel carries the DOKA-B equipment comprising the onboard computer; receiving equipment operating in 145 MHz band;

transmitting equipment operating in 435 MHz

The Russians (Reshetnev) do publish information on their sute but they don't index it, so webspiders don't 'see' their information 'Dark Internet' ... non indexed. This makes finding information rather laborious :-)

Have a look at....
http://www.southgatearc.org/news/january2010/rs38.htm

Other sources say that Yubileiniy-2 launch has been delayed.I think this is more likely.

I think Mike and Nico seem to be the only people with a real interest in the mystery bird. See...
http://www.mail-archive.com/amsat-bb@.../msg06299.html

Yubileiniy-1.....
http://www.amsat.org/amsat-new/satellites/satInfo.php?satID=115
<http://www.amsat.org/amsat-new/satellites/satInfo.php?satID=115&retURL=/satellites/status.php> &retURL=/satellites/status.php

Happy New Year to all.

Hi group.

Perhaps rather off-topic, but with the recent discussions of the status of amateur radio on 70Cms, I think we should be grateful that BMEWS RADARS are no longer on the two metre band. Yes, two metres. 12*2.5MW developed by Klystrons was used on the Thule (Greenland) base in the past. Even I was surprised to discover this :-) I'm sure the move to 70Cms would give the RADARs greater resolving power.

See...
http://www.bwcinet.com/thule/4techdr.htm

The complete article is fairly interesting and starts at..
http://www.bwcinet.com/thule/index.html
with detection and tracking RADARS being the 'juicy' bits.

The website even has a link to CND for RAF Fylingdales, which of course is a primary user in the UK on 70Cms, actually 420-450MHz.

Hello Nader

Thanks for your message. I'm ready for PacSat use, I hope it is stored when I'm QRV for HO-68. I have to observe too many satellites during the weekends. :-) And now I have detected the year 2010 bug in my own written satellite tracker program, I have to solve it first.

Hi Peter

Here is an excerpt from Arianne space news:

Challenges in 2010

Arianespace is planning six to seven Ariane 5 launches in 2010, including the second ATV supply vessel for the International Space Station, the "Johannes Kepler".

The first launch of a Soyuz rocket from the Guiana Space Center is slated for mid-2010. Integration of the mobile gantry started in November, and system tests are scheduled for the first quarter of 2010. To date, Arianespace has ordered 14 launchers from the Russian space industry and all of these launches have been sold. The first two Soyuz launchers are already in French Guiana.

For upcoming Vega launches, the refurbishment of the ELA-1 launch pad is nearly completed. Each of the three solid propulsion stages of this launcher has passed static firing tests. The development of the Vega launcher will be completed in 2010, with commercial launch services kicking off in 2011.

With Ariane 5, Soyuz and Vega, Arianespace now has a family of launchers that gives it even more flexibility to meet customer requirements. Building on these considerable assets, in particular 35 successful launches in a row of Ariane 5, and 21 Soyuz launches from Baikonur, plus a proven commitment to launching on schedule, Arianespace continues to offer the broadest range of launch opportunities, enabling it to maintain its market share and continue its global leadership over the long haul.

Could be Vega will have to pass a first flight launch?

3111. DOKA-B21 page

Yahoo group: eu-amsat
Date: 2010-01-10 15:57:15 UTC
From: Al
Topic: 3111 Message: 3111

Hi group.
The Bauman Institute has a page devoted to the *Command-navigation system of the "Baumanetz" spacecraft* which includes a photo and drawings for the DOKA-B21 system. It's at..

http://microsat.sm.bmstu.ru/eng/epm_sysDOKA.html

for anyone with an interest. If you click on the small drawing, it will open a larger image which can be clicked on again, for a full-page drawing. Perhaps Mike DK3WN, or one of our other Russian readers could translate the captions and re-post it here for the group? I'm sure it would be of interest.

http://microsat.sm.bmstu.ru/pic/scheme.jpg

has a photo of the interior of the Baumanetz craft with a DOKA module in place.

Kollibri-2000 used the same (or a similar) system, so it is now a well established system.

From the IKI website...
"The service remote maintenance equipment ÊÀ-DOKAÁ along with the radio complex provided an efficient interaction of all onboard instruments throughout the microsatellite mission. The command and telemetry radio links had a stable operation for data reception and transmission with Kaluga and Sidney ground control complex and Tarusa telemetry information receiving station in two high frequency ranges of 145 ÌHz and 435 ÌHz."

So now you know.

I believe that DOKA-B was the brainchild of NILAKT ROSTO in Kaluga. I suspect it has been adopted as the standard "remote maintenance" system for Reshetnev's small satellites and is/was standard kit for Yubileiny and Universitetskii-Tatyana plus other microsatellies from the CIS.

Hello Al

Thanks for the infos. See also the site of Radio-Sputnik 21 (Kolibri-2000):
http://www.iki.rssi.ru/kollibri/mission1_e.htm

This satellite and Radio-Sputnik-19 / Spoutnik-99 aka Beatnik or Swatchnik before were the beginning of the new era of Russian satellites (Sputniks) in our 70cm band. "Beatnik" was deployed without batteries from Mir after a storm of protests.

> a storm of protests.

I certainly remember the 'swatchnik' because of the use of amateur radio frequencies for advertising. Hopefully we will never see that again. Kollibri, Tatyana-1 and other small Russian birds have a primary mission to collect geophysical data, in particular auroral studies, with amateur radio providing the means to downlink the data collected. Personally, I believe this is more useful than the continuing stream of University 'clone' Microsats that don't really do anything much of real interest to the average radio amateur, or even the keen satellite operator. This one grabbed my interest.

http://www.powershow.com/view.php?id=P1253037079AeBKS&t=The+Educational+Program+of+Youth+Center+Space+Communications+and+Informatics

and appears to be a genuine attempt to encourage young people into space science.
The Russian agencies seem to have a properly co-ordinated system to study geomagnetism, the Ionosphere, aurora and other near-earth phenomena using micro-satellites.

Have a good evening.

Hi Al,

on the project Kolibri-2000 website you can find also an interesting chart.

Our friend Alex Papkov as vice-leader by DOKA.

OK Al, but why on amateur radio frequencies ? Why does the governments not give other frequency ranges to the universities for free ? Or is this a rethorical question ? I think yes.

Hi group.

The Baumanetz satellites carried DOKA-B system and also a housekeeping computer very similar to that flown on SSETI Express using an ARM7 RISC CPU linked to three 8051 CPUs . The Houskeeping computer for Baumanetz was built at the University of Aalborg. Although the drawings say CAN2B, they also say MIL-1553. MIL-1553 is a standard for avionics and is a mil-spec serial interface bus that is in in common use in military aircraft. I suspect that a MIL-1553 system and not the CANBUS was used. Perhaps someone in the group knows which?

See attached image and also
http://en.wikipedia.org/wiki/MIL-STD-1553.

For the computer.
http://www.control.aau.dk/index.php?id=273
and the mission.

I agree 100% with you Bob and just confirm if you refer to your October 14 post when you wrote it? (Read below) That's exactly what i ask
AMSAT-NA BOD since 4 years now and it will be interesting to see how "swift and sure" their action will have been conducted if this actual
"code of conduct" was in force at that time?

Instead of stigmatizing individual who voices their opinions on subject who at time can be opposed to AMSAT-NA lets see how things will go!

We fortunately have the European AMSAT-EU discussion group where an open minded spirit is present even moderated by people dedicated to
offer an alternate solution to those who are opposed to any censorship as there is a very narrow margin between a moderated forum and
censorship on this very same forum. As you said the effectiveness will entirely be determined not by the stick but by education as what we
read at time in the past on AMSAT-BB was often more a lack of education and politeness lets say "savoir vivre" than anything else.

The education word here should be interpreted in the sense of "Good Manners" If someone don't have an etiquette resource, keep reading for
more ideas. Consider picking up one of many etiquette books. Some colleges offer weekend etiquette lessons, usually open to all ages. This
is a great idea for anyone looking to make a better impression or at least demonstrate that you have a minimal knowledge of how to behave
during group discussion have a polite manner when you choose to differ from the other person´s point of view.

As this new AUP speak about "Acceptable Content" and as AMSAT-NA is declaring "We embrace diversity of opinions and values." we just hope
this is more than words and there is a real intent of fairness in this code of conduct not a tool to silence anyone of does not share the

views and ideas of AMSAT-NA.

Here is your October 14 2009 prose...

3120. Re: AMSAT adopts Acceptable Use Policy for mailing lists

Yahoo group: eu-amsat
Date: 2010-01-15 11:40:55 UTC
From: Luc Leblanc
Topic: 3119 Message: 3120

TO: AMSAT-NA BOD members and Acceptable Use Policy committee

As you can see your noble intents are probably not fulfil yet as Jack KD1PE wrote::

Censorship in any form without external control is unacceptable... I suspect
some with thinner skins than others will find it a convenient screen to hide
behind operating under the guise of "cleaning up the BB... All that was
needed was that if you didn't like it delete it. To adopt something like
this puts you all in the "god" seat. I assume any talk of a HEO is not
entertained (Sorry that is a joke).

DE KD1PE

My previous post is still pending as he is already posted on AMSAT-EU... Is my post is
moderated or censored?

As you invited and refer us to other tribune can you just confirm if those below can be
acceptable? If yes i will be glad and challenged to
used them at my own chosen time.

http://www.asc-csa.gc.ca/eng/forms/form_info.asp
http://www.hq.nasa.gov/office/pao/FOIA/agency/
reginfo@...
http://www.iaru.org/index.html

For those on AMSAT-EU forum we will at least have a "clear" confirmation if the AMSAT-NA BB
is moderated or censored? Some will say we
already have the answer but let see if those who hide themselves behind a committee will
have the courage to defend their actions? Failing
to do so will let this burden to the Acceptable Use Policy committee members just hope we
will not have to interpret any silence as
cowardice?

Just to remind you the Acceptable Use Policy committee members names:

Stephen Belter, N9IP
Alan Biddle, WA4SCA
Mark Hammond, N8MH;
Samudra Haque, N3RDX
Paul Williamson,KB5MU.

Sorry for this repost on AMSAT-EU but it will officially confirm ounce and for all (I hope)
where AMSAT-NA is standing about their own
country Freedom of Information Act. Just to remind the Acceptable Use Policy committee
members they individually and personally endorse
their AUP paper and it is the AMSAT-NA corporation who accepted it protecting on "paper"
their BOD members...Again we don't want to

interpret this move as BOD cowardice.

P.S. Be advise that any personal e-mail i will received regarding this AUP affair can be made public if there is any public interest

Here is the "MODERATED" or "CENSORED" message by AMSAT-NA

On 14 Jan 2010 at 13:11, Bob McGwier wrote:

I agree 100% with you Bob and just confirm if you refer to your October 14 post when you wrote it? (Read below) That's exactly what i ask
AMSAT-NA BOD since 4 years now and it will be interesting to see how "swift and sure" their action will have been conducted if this actual
"code of conduct" was in force at that time?

Instead of stigmatizing individual who voices their opinions on subject who at time can be opposed to AMSAT-NA lets see how things will go!

We fortunately have the European AMSAT-EU discussion group where an open minded spirit is present even moderated by people dedicated to
offer an alternate solution to those who are opposed to any censorship as there is a very narrow margin between a moderated forum and
censorship on this very same forum. As you said the effectiveness will entirely be determined not by the stick but by education as what we
read at time in the past on AMSAT-BB was often more a lack of education and politeness lets say "savoir vivre" than anything else.

The education word here should be interpreted in the sense of "Good Manners" If someone don't have an etiquette resource, keep reading for
more ideas. Consider picking up one of many etiquette books. Some colleges offer weekend etiquette lessons, usually open to all ages. This
is a great idea for anyone looking to make a better impression or at least demonstrate that you have a minimal knowledge of how to behave
during group discussion have a polite manner when you choose to differ from the other person´s point of view.

As this new AUP speak about "Acceptable Content" and as AMSAT-NA is declaring "We embrace diversity of opinions and values." we just hope
this is more than words and there is a real intent of fairness in this code of conduct not a tool to silence anyone of does not share the
views and ideas of AMSAT-NA.

Here is your October 14 2009 prose...

I fully agree Mark the Freedom of Information Act and the Freedom of Speech are different things and AMSAT-NA is already making numerous
breach in the freedom of speech rights and it's bad and it impaired the reputation of AMSAT-NA and his officers.

As Jack says "Censorship in any form without external control is unacceptable..." just check the very same message that i send you never
appears yet on AMSAT-BB i asked if it is censored or moderated? you don't answer directly... this tell me a lot about the about the hidden
intents of AMSAT-NA that we all know is to silence any opinions against AMSAT-NA and his politics.

I appreciate your time spent answering but if you can just reply to my question it will enlighten us all about the real motive behind this
AUP? Failing to do so will only lead to the conclusion that AMSAT-NA, his BOD and his AUP committee members are only pursuing one goal the
"censoring of all his BB."

Yahoo group: eu-amsat
Date: 2010-01-16 05:34:32 UTC
From: Luc Leblanc
Topic: 3123 Message: 3123

For those who are still dreaming for a HEO in the mean time just check below you can have your own LEO/tube sat satellite for 8000$ launch
included payable with the major credit card and you even have payment options!

I'm just waiting to see one of them on E-Bay

As they said "TubeSats are designed to be orbit-friendly. Launches are expected to begin in December of 2010." Probably the replacing
solution for our aging AMSAT-NA satellite fleet? Anyone with 8000$ can own his own satellite let me guess in a couple of years the same
repeater frenzy will also reach the amateur satellite world. No more need of club or organization or IARU frequencies coordination .
The perfect world...

It makes more sense if you spend your $800 to AMSAT-DL than to a "grave satellite".

3125. Sofware for rotators control

Yahoo group: eu-amsat
Date: 2010-01-16 13:20:43 UTC
From: Codrut
Topic: 3125 Message: 3125

I hope somebody will find usefull the PstRotator program. It can be downloaded from www.qsl.net/yo3dmu/index_Page346.htm

PstRotator handles just about every controllable rotator in common use: Prosistel "D" and "C", RT-20 and RT-21 Green Heron, DCU-1 HyGain, RC1 MDS, Rotor-EZ Idiom Press, Easy-Rotor-Control, Yaesu Az and Yaesu Az/El GS-232A and GS-232B, M2 RC2800, AlfaSpid RAK Az and RAS Az/El, Easycomm, ST3 Fox Delta, Endeavour Electronics AutoTracker, ZL1BPU, EGIS, Create RAC825, EA4TX Arswin, DL7AOT, LBV Tracker, PrimeSat and VK5DJ.

PstRotator provides automatic tracking for satelites and EME, using for this WXtrack, WinOrbit, Orbitron, Nova for Windows, Sat_Explorer, SatPC32, WSJT, Z-Track, GJTracker, EME System, Trak_SM, or HRD Satellite Tracker. Also it works with some contest loggers like N1MM, TACLog and Win-Test. Other programs supported are MixW, DXView, VQLog and Ham Radio Deluxe v5 (HRD Logbook).

Tracking the moon is easier now using an internal algorithm.

PstRotator supports multiuser remote control over TCP/IP.

Antenna can be pointed on any direction with:
- mouse click on a map,
- mouse click on the compass rose,
- left/right/up/down keyboard arrows,
- setting the azimuth / elevation,
- setting the QRA locator (4, 6 or 8 digits),
- selecting the DXCC,
- typing a callsign,

73, Codrut - YO3DMU

3126. Re: LEO/cube sat for sale 8000$

Yahoo group: eu-amsat
Date: 2010-01-16 15:33:26 UTC
From: Al
Topic: 3123 Message: 3126

Hi group,
Re Luc's posting, I was more interested in the suggested users for a Tubesat..Viz

Earth-from-space video imaging
Earth magnetic field measurement
Satellite orientation detection (horizon sensor, gyros, accelerometers, etc.)
Orbital environment measurements (temperature, pressure, radiation, etc.)
On-orbit hardware and software component testing (microprocessors, etc.)
Tracking migratory animals from orbit
Testing satellite stabilization methods
Biological experiments
On-orbit advertising
Private e-mail
Space art
Space burials

While these little birds may well be very useful for the suggested uses, there's no sign of amateur radio satellites anywhere in there. Have they missed an opportunity, or does the company consider short lived LEO birds (just like like most CUBESATS) not worthy of their advertising attention? After all, $8000 a pop *is* pretty cheap. I'd have expected at least some AMSAT groups to jump at the chance of such a launch, given the popularity, in some quarters at least, of CUBESATS. I don't see any reason why some of these birds couldn't have AMSAT-OSCAR-Something-or-other designations, just to add to the fun and confusion we already have with multiple satellite naming. Admittedly you wouldn't hope to work DX on such a bird, should working DX be what 'floats your boat', it isn't mine, but I don't get how they are really any different from existing CUBESATS, except for cost.
Small, lousy power budget, low orbit, and useless for transponding. Other than that... just great! It's just an even less expensive way to fire swarms of 'me too's' into space. We already have such a system, but this seems to be cheaper... *if* their launcher works. If it does, we can look forward to lots of new 'amateur radio' beepsats on the bands.

Over my dead body if one day i won our local provincial loto that's what i will probably do if i get more than my usual 2$... I just hope
AMSAT-NA will not be tempted by this idea with their degrading financial position...even their voluntary hours system is not working.

You just open my can of worm Thomas... and here is some of my general thoughts

They are now confirming on paper their freedom of speech denial confirming and validating the very useful nature of AMSAT-EU discussion
group where we can have open discussion and respecting the others rights to have a different opinion.

Regretfully i am ashamed that in 2010 there is an amateur satellite radio association who is now working as an inquisition tribunal in
censoring anyone who's against their ideas and asking the world under the amateur radio international space station program namely called
ARISS program to promote the space program to the youth when they are not respecting one of the human right article "The speech freedom"

That AMSAT-NA does not respect the freedom of speech is not new and it just increased as per this equation y=c/x where x is their declining
multiple of 2 factor. But that the SAREX mailing list is also under the same anti democratic ruling is innacceptable and it is my goal to
let the world aware of it by any mean available. Thank's to AMSAT-NA offering me this new challenge i just hope the world amateur radio
community will be now more aware of what this declining group is doing making now more harm to amateur radio than anything useful.(My own
evaluation but feel free to correct me here)

Another sign of their declining state no one and absolutely no one never in years in their various BOD members and blinded supporters where
able to answer directly my questions just see the last one address to one of their AUP committee member:

The usual way they answer is to try to patronized all the NAYS opinion with this kind of arguement given by KG4ZLB Sir David A Worboys
formerly M0ZLB who came in America depriving UK from his skilful acute judgement and phlegmatic prose. Here is one of his best probably
inspired under a senior moment or caused by the last week too much outside freezing temperature head exposure. I'm joking evidently but
just to remind all of us we still have the right to discuss with some humour touch but i failed to detect any in some authors text!

"Quote"

"We all know who they are; the ones that immediately post a facetious
reply to a newbie question, the ones that post one line,or worse still,
one word answers that are ambiguous at best and downright rude at worst;
the ones that take childish delight in trying to elicit the maximum
controversy with seemingly innocuous postings"

"end of quote"

Yes David we all know who they are but they have the right to express and voice their opinion (Even if we can disagree about their ways who
we are to judge them?) (Telling them directly and politely in private often make's them reconsider their manners the stick never work) It
is not why you came in the US in 2003? Or have you been dragged by some other incentive?

Any way i looked forward to have an eyeball QSO
with you pretty soon you seems to be a fantastic character to meet and discuss with and probably well inclined in human relationship and we
always have our past track record to ascertained our behavioural problems. Again it is not directed toward anyone your post just offer me a
way to let the others know how to not behave in a group discussion as i wrote in a previous post who was censored on AMSAT-BB. I just hope
you don't cut all your links with Europe and UK and that you will joined the EU-AMSAT discussion group if it's not already done we will all
gained to read your always on topic post.

If we scrape just a bit our outside envelop we always find that we all have the same goals but what's make's us unique is how shallow
theses intents are.

P.S. It's funny to see the last AMSAT-NA Bob McGwier, N4HY post pass through and all mine are blocked? Another AMSAT-NA double standard?
Poor Bob and poor AMSAT-NA Does anyone can explain why he's passing the AUP and not me!!!
And Bob just hope you can find some help in what
i wrote above i will pray for you and in the mean time the only one direct way i can use to ease you pain is to try to help you with the
following lines.

Here is some text who i hope can be of some help to us all.

Criticism is the judgment (using analysis and evaluation) of the merits and faults of the actions or work of another individual. Criticism
can mean merely to evaluate without necessarily finding fault; however, usually the word implies the expression of disapproval.

Vulnerability with their own self-esteem makes individuals with narcissistic personality disorder very sensitive to criticism or defeat.
Although they may not show it outwardly, criticism may haunt them and leave them feeling humiliated, degraded, hollow, and empty. They may
react with disdain, narcissistic rage, or defiant counterattack.

Narcissists are extremely sensitive to personal criticism and extremely critical of other people. They think that they must be seen as
perfect or superior or infallible or else they are worthless. There's no middle ground

The narcissist is constantly on the lookout for slights. He is hypervigilant. He perceives every disagreement as criticism and every
critical remark as complete and humiliating rejection: nothing short of a threat.

Criticism and paranoids

Individuals with paranoid personality disorder are often rigid, critical of others, although they have great difficulty accepting criticism
themselves.

Criticism and avoidants

Individuals with avoidant personality disorder are hypersensitive to criticism or rejection. They build up a defensive shell.

Live long and prosper!

Phase-3E News
==========

Update Satellit (Hardware)

Peter, DB2OS, informierte an der ausserordentlichen Mitgliederversammlung am 10. Oktober 2009 ?ber Phase-3E. Die Mechanik des Satelliten ist fertig. Auch viele Module, die sich meistens noch bei den Entwicklern befinden.

Im Anschluss an die ausserordentliche Mitgliederversammlung am 10. Oktober 2009 gab es einen wichtigen Meilenstein am Projekt zu feiern. Mario, DL5MLO, f?hrte an dem in Deutschland hergestellten Ingenieursmodell der IHU-3 den Datentransfer zwischen der IHU-3 und einem Laptop ?ber die 400 bit/s PSK Schnittstelle vor. OM Dr. Karl Meinzer liess es sich nicht nehmen, sofort einige IPS-Kommandos an den Bordrechner abzusetzen um mit voller Freude die korrekte Antwort im Display des Laptop zu sehen. ?ber diese Datenkommunikation wird im Flugbetrieb P3E kontrolliert und gesteuert werden.

Allerdings gibt es noch viel zu tun. Bisher gibt es nur einen Prototypen auf Basis des letzten Layout-Standes. Aufgrund verschiedener ?nderungen im Schaltplan und nicht mehr verf?gbarer oder besserer Bauteile muss das gesamte Layout ?berarbeitet bzw. neu erstellt werden.

Mit dem Bau der IHU-3, CAN-DO!-Bus und dem SDX bei AMSAT-DL ist Phase-3E nun "ITAR-free", also frei von Exportrestriktionen der USA. Diese Module wurden auch als Hilfeleistung von Mitgliedern der AMSAT-NA entwickelt.

Startkosten

Ein Satellitenstart mit der Ariane kostet etwa 3 Millionen Euro. Als Alternative zu Ariane und Sojuz k?me die neue Agentur SpaceX in Frage. Es wurde ?ber die M?glichkeiten einer preisg?nstigen Mitfluggelegenheit f?r P3E auf einer der Falcon-9-Raketen gesprochen. Derzeit liegen die genannten Preise f?r einen regul?ren Falcon-9-Start allerdings ausserhalb der finanziellen M?glichkeiten der AMSAT-DL. W?hrend des Gespr?chs deutete sich jedoch eine vage M?glichkeit an, wie man die Kosten reduzieren k?nnte. AMSAT-DL wird daher weiterhin mit SpaceX in Kontakt bleiben.

Die Finanzierung der Startkosten soll durch die Marsmisssion P5A erfolgen. Zur Machbarkeit von P5A mit jeweils 10 Millionen Euro f?r Start und Bau wurde mit der DLR die Erstellung einer Studie vereinbart. Da bis zur m?glichen Verwirklichung des P5A-Projektes in den Jahren 2016 bis 2018 eine relativ lange Zeit bleibt, w?re eine von der deutschen Regierung

angedachte Mondmission f?r die AMSAT-DL ebenfalls interessant.

P5-Mond-Mission

Hartmut, DL1YDD, erl?uterte, dass Gespr?che im September 2009 mit der DLR auf technischer Ebene stattfanden. Eine Mondmission als Zwischenschritt zu einer Marsmission, mit einer Sonde in einem 100-km-Orbit um den Mond, w?re im Jahre 2014 m?glich.

Das Satellitendesign f?r die P5-Mond-Mission soll, wie auch die P5-Mars-Mission, auf der P3D-Struktur von AO-40 basieren. ?ber weitere Details soll nach Abschluss der zurzeit laufenden sechsmonatigen DLR/AMSAT-DL-Studie im Fr?hjahr 2010 berichtet werden.

***

Phase-3E News
==========

Satellite Update (Hardware)

Peter, DB2OS, informed at the extraordinary general meeting at 10 October 2009 about Phase-3E. The mechanics of the satellite is ready. Also many modules are mostly still at the developers.

Following the extraordinary general meeting there were celebrating a major milestone in the project. Mario, DL5MLO, showed the data transfer between a in Germany produced engineering model of the IHU-3 and a notebook with 400 bps PSK.

OM Dr. Karl Meinzer takes immediately some IPS commands to the onboard computer enjoying to see the correct answer in the display of the laptop. With this data communications P3E will be monitored and controlled in flight.

However, there is still much to do. So far there is only a prototype at basic layout of the last stand. Due to various changes in the schematic and no longer available or improved components all layouts will be revised or newly created.

The construction of the IHU-3, CAN-DO! Bus and the SDX at AMSAT-DL, Phase-3E is now "ITAR-free", ie free of export restrictions in the U.S.. These modules were developed also as an aid by members of AMSAT-NA.

Launch costs

A satellite launch with the Ariane will cost about 3 million Euros. An alternative to Ariane and Soyuz could be the new agency SpaceX. It was talked about the possibilities for an inexpensive launch for P3E with one of the Falcon 9 rockets. At present, the prices for a regular Falcon-9-start,
however, are outside the financial resources of AMSAT-DL. During the interview, there were signs however, a vague possibility of how to reduce

costs. AMSAT-DL will therefore continue to remain in contact with SpaceX.

The financing of launch costs would be done by the Mars P5A mission. For the feasibility of P5A with costs of 10 million Euros for each start and developing it was agreed with DLR the creation of a study. As to possible realization of the project P5A in the years 2016 to 2018 a relatively long time to be a by the German government rethought mission to the Moon for AMSAT-DL would also be interesting.

P5-Moon mission

Hartmut, DL1YDD, said that talks in September 2009 with the DLR at technical level took place. A lunar mission as an intermediate step to a Mars mission would be equipped with a probe in a 100-km orbit around the Moon and possible
in the year 2014.

The satellite design for the P5-Moon mission is, as the P5-Mars mission, based on the P3D structure of AO-40. Further details will follow after completion of the currently for six months pending DLR/AMSAT-DL-study in spring 2010.

3130. Tubesats in the 433MHz amateur band?

Yahoo group: eu-amsat
Date: 2010-01-16 18:51:13 UTC
From: Al
Topic: 3130 Message: 3130

Hi,

A quick perusal of the TUBESAT website shows 433Mhz featured as an 'amateur radio band' frequency of choice, while other suggested frequencies are license exempt. Check for yourself at..
http://groups.yahoo.com/group/eu-amsat/photos/album/952508366/pic/663187172/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc
or look up the screen snapshot in the GM1SXX photo folder on this website. So much for the list of proposed uses for these birds, which didn't even mention amateur radio. Calling them amateur radio birds is the 'cheap option' of course. We are being taken for a ride. Nothing new there then. Of course, no doubt once launches start happening, they will probably be assigned 'OSCAR' numbers, and no doubt they will become 'educational' amateur radio satellites, for a short while at least (thankfully) until they fall out of the sky.

Of course the vendors of TUBESATs *could* have chosen 433.920 which is license-exempt in many countries, and then they wouldn't need to be 'amateur radio' craft but they *would* have to compete with car-locking systems and a raft of other short-range, but often quite strong signals from license-exempt gear. Finally, I'd suggest that 433 is a very strange choice of 'amateur' frequency when most birds are above 435. That doesn't seem to fit with current satellite frequency planning. I'll watch with interest.

73 Al.

> in Tubesats instead in Cubesats. ;-)

Well Thomas, I don't see any real difference between CUBESAT's and TUBESATS, except that if the idea works, TUBESATS will be even cheaper, and therefore even more accessible to Universities. Lets not kid ourselves though that these will be 'amateur radio' birds. In the education sector, it's about ticking boxes on exam papers, for student degree level passes, not about providing anything remotely useful to the average radio amateur. For the average amateur, they are just more clutter on 70Cms. So for universities, it won't matter either way, so long as they get to keep their 'downlink only' beepsats on 70Cms.

Of course, I wouldn't ever presume to post this sort of reply on the AMSAT-BB. It would probably be censored by those who proposed 'getting into bed' with the education sector in the first instance;-)
At the time I thought it was a lousy idea. I still do.

I don't normally bother reading the AMSAT-BB.. too much angst and vitriol for my liking, but I was pointed there recently to see the contrast between 'there' and 'here'. Fortunately, although this is a moderated group,(for commonsense reasons), we don't censor stuff, unless extreme bad language id used, or if someone is being attacked personally, so thankfully democracy is permitted and encouraged here. It's reflected in the success of this group. Thanks all. YOU guys make it possible.

73 Al.
GM1SXX
Post Scriptum. I have only ever rejected a couple of emails to this group in my time as moderator. They came from a virused PC of a group member and were not originated by said member. His problem has now been resolved, and he was in no way responsible for it.

Hello Al

When in future the universities will fly their experiments in Tubesats
on 433 MHz this will free our 437 MHz band. And because of the lower
hight this satellites will earlier "decease". This were my thoughts.

$1.00 in 1975 had about the same buying power as $4.05 in 2009.

Annual inflation over this period was about 4.2%.

A 50$ life membership in 1975 worth 202.50$ in 2009 but the actual AMSAT-NA life membership is at 880$!!!

I don't know how this 880$ has been calculated but someone will surely come up with an explanation?

From: st2nh
Topic: 3136 Message: 3136

HI all
In a semi-quiet pass over Africa I`ve succeeded to up loaded 8 messages to HOPE-1 BBS.

Messages to
1- WA4SCA
2 - BA1DU
3 - TO ALL
4 - JE9PEL
5 - N8MH
6 - I7PQD
7 - DD1JSN
8 - TO ALL

See a movie at youtube channel
http://www.youtube.com/st2nh

(sry for flickering from an old monitor)

Message with attached file (photo) also uploaded.
The photo I've paint and uploaded carried a QST message to save Forest and Trees.
More useful meaning to BBS in time of fast DSL

The Directory was empty! I wish to receive a reply soon. Really FM killing the packet or vice versa . I'm lucky coz I'm here in quiet Africa. (Not so quiet, Not so lucky with DXCC)

The all-week, one-mode Schedule should give a chance to many hams to read and upload their messages before deleted by OBC. . Thanks Alan for this arrangement which had been suggested by my Elmer Mr. Dom.

Many Friends sent me an email asking about WISP setup!!
Here every thing in it default setting. I haven't change any thing only I've added the
Broadcast and BBS callsign . I'm using an old PC Pentium 2 ,OS is XP.

Did you ever believe that anyone who's censoring someone will openly admitted it? They will try to justify it using any kind of fallacious
argument but as soon as you refrain someone asking questions or exposing his view or criticizing what he believe is wrong you effectively
censored him.

Just remember in the AO-40 era there was nearly no criticism on the AMSAT-BB as they where no ground for it. In the actual situation where
there was only hollow project who where never completed and those still in the making who are not going in the right direction no one the
AMSAT-NA never come up explaining why they still prefer an FM one channel sat instead of a linear transponder sat.

There is P3E who's going in the right direction instead of hiding behind ITAR AMSAT-NA should push more in a way to help to launch this
project. I don't know if ITAR has ever been an issue with the inter orbital TubeSat Personal Satellite kit
http://interorbital.com/TubeSat_1.htm but hey are making their kit available all over the planet!!! and with only a credit card...

There will always be 100 good explanations to justify wrong moves. If some voices against some of them is hurting so much that AMSAT-NA
only want to have them stopped it is censorship or called it the way you want.

Even if some text are not constructive enough at the taste of some it is an insult to the intelligence of the readers when you have to
censored them it is like if all the AMSAT-NA readers where unable to evaluate a post at his own merit. Did the AMSAT-NA readers are so dumb
that they are unable to have any sense of judgement?

Stopping as this AUP says Illegal, Insulting, abusive, harassing, or threatening message is the way to go but the knowingly false or
misrepresentative point is not well presented. As many discussion forum that i'm registered on the moderator always check if it is related
to the forum or if it is posted in the right forum section. Someone come up with an idea to have another forum to discuss non technical
issues. Just switched this idea a new forum only for technical discussion and when i said technical only that's. What i mean is all the sat
news ARISS news and ANS politics ruling and son on can still be on the actual AMSAT-BB. If someone wants to let the AMSAT-BB aware of a
specific technical discussion thread he can only just put a 2 line post on AMSAT-BB letting all know of whats the tech actual hot topic of
discussion is.

I can even suggest a name for this new BB "LUCTECH-BB"

This way it will send those technically inclined on their own protected and filtered forum and all the other on AMSAT-NA BB. If as it was
often the case the teckies start their rampage it will be on their own forum and those argumenting about the real north position ad nauseam
will be free to go ad lib on this tech forum.

Two separate BB one TECH and the other for general satellite non technical discussion eg: news, satellite schedule of operation, major
satellite change and so on. The rotor issues antenna problem preamp issues ect will be on this tech forum and why not implementing an FAQ
section where these always returning questions who often came when a new reader come on board can be classify by topic. It will give them
some post to read about their question.

Also save us from your patronizing post as: "behave like an adult" and "that's protecting their own resources" and just see the reality of
what this AUP in this actual form can lead too. I know some prefer to live in a double standard world where what they feel wrong for the
other is right for them but it doesn't work any more on a planet where we are all now very close by our communication tools.

Sorry Thomas, for some reason, I didn't read your posting, and I'd like to try to answer this one.
If you check on any of the offical websites re spectrum usage, such as OFCOM's in the UK, you will discover that the radio spectrum is heavily used and allocated already.

You asked "Why does the governments not give other frequency ranges to the universities for free ?".

Governments don't allocate spectrum space, The ITU does.
The IARU have to work with what they are allocated by International (not Government) decree. There is not much freedom to give Universities frequencies that are not already allocated to other users. The IARU have to try to keep everyone happy within the amateur radio bands and because they have no powers to allocate new frequencies to users, there is not much that they can do about the situation apart from frequency co-ordination.

Bear in mind also that apart from 2M where we are the primary user, most other 'useful' satellite allocations are on a secondary basis.
In most countries, the military and ISM users are the primary users on bands of interest to us, and therefore we have no real cause for complaint.

I personally would like to see amateur satellites and educational satellites on different bands, but the precedent was set a long time ago, and nobody really complained except for a handful of individuals so we are left with the situation we find ourselves in today, a situation of our own making that can only deteriorate further. We have no-one to blame except ourselves.

Hello Al

You are right, I made a mistake. I meant licences for other frequency ranges for free.

There is another problem. I don't know any organisation, whether HAM radio clubs nor AMSAT-organisations, who represents our interests at ITU. Do you know one ? If I compare endeavours for short wave and satellite use, we haven't wonder us, when we lose our frequencies. The 40m band is enlarged from 7.1 to 7.3 MHz for example.

Amateur satellites are just one competing use for the bands. I suspect that AMSAT do have some representation at IARU and ITU level, perhaps via the IARU satellite co-ordinator? Thomas has raised an interesting point. Perhaps another group member has the answer to this question? I would be surprised indeed if the amateur satellite fraternity has no representation at ITU level. Answers anyone?

As internet gets his toll on the Ham rank's Twitter will probably be the last coffin nail...the more the evolution goes the more our cube
sats's will be consider "old and useless technology" If it was not the wisdom and vision of our friends from China and South-Africa we will
only get BIP university sats taking the ham bands as their first cheap communication alternative. Giving nothing in return as 2 way
communication availability.

Just check "http://twitter.com/@Astro_TJ"

Where is D20 ? In the interface or in the transceiver ? I would never
remove or cut a diode in a transceiver.

3149. Coaxial line question

Yahoo group: eu-amsat
Date: 2010-01-24 10:04:21 UTC
From: Luc Leblanc
Topic: 3149 Message: 3149

Yes again a returning question "preamp at the tower or near the shack"

I will have to do soon some maintenance work on my satellite antennas tower. I planned to use 2 heliax 1/78" 45' individual line. Each
line will be terminated by high quality 2psp coaxial microwave switch feeding UHF and VHF antennas. I don't know if i can move my VHF and
UHF preamp at the other end near the shack where each line will enter the house on short LMR 400 run 10 feet max?

I know the theory says the best place to put a preamp is at the antenna but with the very low loss on the Heliax coaxial line, is in the
real world there will be any significant degradation in the noise figures who will be really noticeable?

Note: If the relays are introducing too much loss i can feed the antenna directly from them on the 8' run on LMR-400 directly on the female
N type heliax connector.

P.S. One commercial microwave technician is telling me that i will be able to see difference only on labs spectrum/signal generator in
short i will be unable to tell any difference due to the short length of my coaxial line. He told me he's playing with 300 to 600 feets of
lines in his day to day work and 45 feet heliax run are nearly consider as jumper line in his world...

Luc,
You're absolutely right on all points.

The keyword is 'noticable'.

Theory v practice.

If you have an EXPENSIVE spectrum analyser you *WILL* see a difference ... if you use your ears ... you *WON'T* ... (as I'm quite sure you already know).

It's all down to the *ACTUAL*noise figure and what your ears hear (in analogue).
Digital *MAY* (or may not) be a different matter.

I have the article that addresses this subject in case you want to do the math. I can scan it and email to you.

With heliax, I don't think it makes much difference.

I'm running 100 ft. of 9913 here. With this long run and type coax, I think mounting a pre amp at the antenna is better. I do use CW and copy sinals close to the noise floor.

All the best from Indiana.

Hi Mike

I will be glad to have a look at it. I try the spreadsheet of Ed KL7UW but i have many figures that i missed the insertion losses (The
Icom AG-35 noise figures is on of them). I will perform the Heliax test first on a dummy load to be sure of the loss of the 45' run. I have
actually about 50' of LMR-400. the heliax will give me .56db and the LMR-400 1.35db of attenuation. If all theses losses added up to the
noise figures before the receiver and keeping the preamp at the antenna it should normally reduce my noise floor but this .79db of
difference will it be detectable i think not.

If i put the preamp near the shack the 1.35db can probably have some effect but on the heliax adding .56db will also not be noticeable.

UHF is my big concern and it's where i will concentrate my works.

Someone wrote:

If you are running a modest length of heliax (and if not, why not?!!!), then any benefits of a preamp will diminish.
Then, it becomes a question of whether all the hassle (extra connectors, insertion loss, blowing transistors, etc) and expense is worth it.

Next time i will test the Yaesu 847 internal preamp with the AG-35 this will tell me first if on the LMR 400 i can see a difference.

Thank's for the article Mike

3155. Surrey Space Technology in the news.

Yahoo group: eu-amsat
Date: 2010-01-26 08:20:47 UTC
From: Al
Topic: 3155 Message: 3155

Hi group,

With the current dire financial situation globally, it's nice to know there are still success stories. Surrey Space Technology Limited is one of them and the company was featured in today's UK BBC TV news.
You can see more at..
http://news.bbc.co.uk/1/hi/business/8480095.stm

SSTL are a major contractor for the Galileo GPS system, and of course in the past they also built the UoSAT birds. Other projects included some of the DMC (Disaster Monitoring Constellation) imaging satellites.

I've visited SSTL a few times in the past and it's a fascinating place.

3156. L band QRM?

Yahoo group: eu-amsat
Date: 2010-01-27 04:19:57 UTC
From: Luc Leblanc
Topic: 3156 Message: 3156

Excerpt from Jet Propulsion Laboratory news: NASA Airborne Radar to Study Quake Faults in Haiti, Dominican Republic

PASADENA, Calif. - In response to the disaster in Haiti on Jan. 12, NASA has added a series of science overflights of earthquake faults in
Haiti and the Dominican Republic on the island of Hispaniola to a previously scheduled three-week airborne radar campaign to Central
America.

"CUT"

During its trek to Central America, which will run through mid-February, the repeat-pass L-band wavelength radar, developed by NASA's Jet
Propulsion Laboratory, Pasadena, Calif., will study the structure of tropical forests; monitor volcanic deformation and volcano processes;
and examine Mayan archeology sites. After the Haitian earthquake, NASA managers added additional science objectives that will allow
UAVSAR's unique observational capabilities to study geologic processes in Hispaniola following the earthquake. UAVSAR's ability to provide
rapid access to regions of interest, short repeat flight intervals, high resolution and its variable viewing geometry make it a powerful
tool for studying ongoing Earth processes.

The full version of this story with accompanying images is at:
http://www.jpl.nasa.gov/news/news.cfm?release=2010-031&cid=release_2010-031

I don't know if AO-51 will be QRM'ed by this L band radar but it will be interesting to monitor it if the L band receiver is activated.

There is nothing special about this news but when put in context of the following article it look likes a strange coincidence... Could be
my imagination was too excited as i just return from the cinema 3 hours presentation of Avatar in 3D?

Hello Florian

Thanks for the infos. I have compiled a big list of coming satellites.
The list is in German, but the links refers to the original home pages
and articles, mostly from Southgate ARC. See the 2nd half of the site
http://www.amsat-dl.org/index.php/satelliten-mainmenu-76/ersicht-aller-mainmenu-102

Yes, why not ? ;-) As we learned the 70cm band is not allocated primary
for us. But its better, this devices sends on 433 than on 435 MHz. I
can receive one on 435.995 MHz. I mean its a weather station.

Hello Group,
I note that today's Amsat News Service bulletin quotes the Japanese KySat that will soon be heading for Venus, as having an uplink on 2Ghz and a downlink on 13.2Ghz.

You can now all run out and buy 60 meter diameter 'Bochum' dish.

Amateur satellite? ... hrmm ... right !!!. I've yet to see an 'amateur' receiver on 13.2Ghz.

Did somebody mention the word 'university' ?? ... (continually, for the last 11 years).

Well, the robots may already be here, alongside your car locking system and many of the other 'social conveniences' we pretty much take from granted. 433Mhz is the band of choice for many of these devices with 433.930MHz being a favourite frequency. Many of these devices used the PIC Keeloq 'rolling-code' encryption system for security. My cordless switched electrical mains plugs are on 433.920. It's easily copied on my 70Cms handy. Don't worry folks, they're perfectly legal, just like your car key... on 70Cms!

We share 70Cms with other users, just like 2.4GHz, and we have no right to complain about other users of the band, who unlike us *may* have Primary status, meaning that we must not cause interference to them. It's nothing new. 13Cms is even busier than 70CMs in most urban areas, and we are secondary users there also.

Some interesting links..

Topic: 3163 Message: 3163
Attachments: 1 described; binary payloads are missing from this source WARC

OBSERVATIONS FROM NORWAY. 010220101030Z.

Satellite Remote - (portable).

Subtitle: How to control your station from afar.

Where on earth is afar, - (you may well ask) ...

'Afar' is a hamlet (not omlet) situated about 200 km south of Tobruk in the Sahara desert in Libya ... (bin there - dunnit).

(kidding! ... though I have! been there - but the hamlet is called Jairabub, not Afar).

The circuit shown will allow you to turn your computer and rigs on from afar, (remotely) using RDM software and your mobile phone. then turn them off again, together with your computer, after completing a QSO.

It can be seen that judicial use of relays and a sequencer circuit will allow you to control
other applications at your home QTH. The sequencer may6 be as simple as an LM324 quad opamp or a series of NE555 timer circuits.

Doppler tracking (in my case InstantTRACK, because I use 22 year old rigs without a CAT interface) and aerial tracking (NOVA) can be controlled remotely (directly) from your desktop by your mobile phone with the RDM software.

Primarily, the circuit as shown, is to allow the reliable on and off switching of the rigs themselves before and after a QSO. There's a myriad of 'WAKE FROM SLEE softtware available on the internet for those not wishing to leave their computer on for days on end.

With a bit of initiative, you can figure out many6 more uses for this simple but effective circuit.

The original idea was inspired by Bill Bowden in 2005 but at that time had nothing to do with satellites. The 'blame' for that resides solely with La2qaa.

Also note these links. A simple mod (cut a link in battery compartment) can convert PMR 446 radios into 4 watt output rigs covering 433.075-435.525 MHz.

Intek DRS-5070 PMR-446 Radio

There has also been interference to the satellite segments from D-STAR repeaters which is covered in editions 52 and 53 of the free IARU-R1 VHF/UHF/uW newsletter.
BTW Edition 53 also contains the forthcoming Vienna conference papers.

See these links:

Edition 53 IARU-R1 VHF/UHF/uW Newsletter

Who needs to bother about CB on 70Cms when we have quite a few MM3's and the odd GMx station on both 70Cms and 2 metres who think they are still on Chicken Band. If you need to be convinced that the 'new' three tier licensing system in the UK is not working, check out this site for yourself. http://csinformer.blogspot.com/ I'm certain that OFCOM know about these going's on, but they have not done anything about it. Welcome to the new style 'amateur radio'.

Group,
I listened to this recording ... http://csinformer.blogspot.com/

For a lot of people, the Scots accent will be hard to interpret but I can assure you, the on-air profanity and general behaviour is absolutely disgraceful.

How or why this particular station retains an amateur radio licence is beyond my comprehension. Surely the regulating body could do something about this - particularly since they've obviously and repeatedly been made aware of the problem.

All I can think of to say is ... R.I.P. amateur radio. I'd be ashamed !!! to tell anyone listening to that recording that I'm a radio amateur.

The end of an era.

My callsign hasn't been heard on a satellite for well over 6 months now (nor via a VHF repeater or on HF either)

Call me an old Fart, whatever, I don't mind. As I stated in a previous post, when my daughter can 'tweet' to the ISS astronaughts with her mobile phone - it's time to throw in the towel (at least for me).

I have my station set up for fully automated 'remote portable' using a mobile phone. Technology at it's best ... boring ... boring ... boring.

<http://www.observations.biz/Observations_from_Norway/OBSNOGFEB2010/index.htm>

Ohh! for the days of RS-10 ... Da !!!!.

Hello Florian,
Nice film clip. Brings back a few memories when radio was 'radio' and
licensed radio amateurs were respected.

I think most amateurs who were operating at that time - (56 years ago) - will agree that
amateur radio has really gone down the tube in the last two decades.

Personally, I don't intend to make a fuss about it, I'll just bow out (semi) gracefully,
but
I will carry on with the EU-Amsat group as long as I'm able.

Ofcom removed the restrictions on bad language also the playing of music and political/religious discussions in the December 2006 licence revision.

They now regard language that can be heard in the street as being acceptable, see

Thanks for mentioning this website. I thoroughly enjoyed this movie as I'm fluent in French.

BTW, since bad language has been mentioned in other posts, it is interesting that the captain of the boat uses quite foul language when he can't make contact on his commercial rig, but uses much more appropriate language on the ham set!

Interesting that Trevor should point readers in this direction, because one particular individual abusing the GB3CS repeater also regularly threatens other users, and doesn't mince his words, and has been captured doing so in some of these recordings. IMHO OFCOM should be taking action against this person. I suspect that OFCOM now simply see amateur radio as a thorn in their side, and not an asset. After all, we don't directly earn them revenue and thats what OFCOM's remit is all about. I was far happier in the past to pay my annual license fee, and get a little bit of representation at a national level.

Trevor,
Thanks for the posting.

In my opinion, the standard of operating has dropped DRAMATICALLY since the powers that be decided on no code licenses (regardless of whether one likes the code or not). The 'tick-box' mentality at work.

bææ ... bææ ... bææ ... (the sound of sheep).

While I have the keyboard ... not only am I ashamed to be an amateur these days, I'm also ashamed to be English. A once proud nation is now a 'lackey' of the European Union.

I repeat ... 'my opinion'.

Hi group,
Having looked at the files Trevor provided links to, it would seem that the authorities, especially OFCOM in the UK, are simply not interested in pursuing those who abuse others on the air. There is nothing for them to gain from it financially. It also doesn't help our cause when the lawmakers don't appear to understand the radio medium which is international in nature. The IARU don't seem to be overly bothered either.

I do disagree that Morse Code was the main factor for the degradation in standards. After all, in the UK at least, Morse was the *only* difference between and A and B license. We *all* sat the same two exams. That was the only route into amateur radio. There was far less jamming and abuse in Scotland at least, when the actual license was a bigger privilege, and when radio amateurs had some proper representation.

I'd suggest the current 'dumbed-down' approach to amateur radio where Foundation licensees only need to correctly answer 18 'tick-box' questions to gain access to many bands at the 10W level (10W? as if!) is to blame for much of the abuse thats now all so common. Intermediate licensees have 50W and many bands for only a very little more work.
50W? Yeah sure!

There is a gulf in terms of educational expectation between Intermediate and Full licenses. I believe that this needs to be addressed.

The Full (UK) exam now is pretty much the same as the one that both Class A's and B's in the UK sat for *many* years. Ask yourself...Why is the Chicken Band so quiet now? Well, I think we all know the answer to that one :-) In our area, there's only one active CB frequency, where the abusers go when they can't be bothered abusing decent people any more on 2M and 70Cms.

Finally, although this post is OT, I make no apologies for posting it here, on a BB where common-sense and good manners prevail. Thanks group. I can't think of anywhere else where it could be posted to be honest.

3184. Zoo in space

Yahoo group: eu-amsat
Date: 2010-02-04 03:16:34 UTC
From: Luc Leblanc
Topic: 3184 Message: 3184

Iran reportedly launched a rat, two turtles, and worms into space on Feb. 2 by a Kavoshgar 3 (Explorer) rocket. Officials said the Simorgh
rocket can carry a satellite weighing 220 pounds (100 kilograms) up to 310 miles (500 kilometers) above the Earth.

Orbital elements for the satellite and rocket upper stage (Which is which not known yet)
Some are reporting hearing something around 465MHZ

2009-004A
1 33506U 09004A 09034.19387999 .00095226 13865-4 25133-3 0 80
2 33506 55.5083 313.4501 0099270 151.1927 209.4657 15.86589494 74

2009-004B
1 33507U 09004B 09034.19673867 .00095923 13300-4 31019-3 0 92
2 33507 55.5529 313.4400 0144903 154.1368 206.6998 15.75803087 65

Don't know when the satellite will reenter just hope it will be this next summer just on time for the summer BBQ a bit less hard on the
stomach than nukes...

P.S. at the speed this rocket start his ride i think the accelaration probably killed some members of the animal menagerie...

3186. OFCOM in the UK plan to sell off part of the 10Ghz satellite band.

Yahoo group: eu-amsat
Date: 2010-02-04 09:05:10 UTC
From: Al
Topic: 3186 Message: 3186

Hi group.

I discovered some of this material on the RSGB website today.
Nice to know that OFCON (pun intentional!) are fighting in our corner by trying to sell off yet another valuable resource.

To be fair though, their mandate is to maximise the financial return from the radio spectrum, and therefore we cannot even compete.

See..

http://www.rsgb.org/spectrumforum/pdfs/consultations/08_10_30_low_power_licence_exemption.pdf

http://www.rsgb.org/spectrumforum/pdfs/consultations/07_09_17_Joint_Response_to_Ofcom_10_GHz_proposal.pdf

http://www.rsgb.org/spectrumforum/pdfs/consultations/07_02_08_Feb-2007-Joint-10-40GHz-reply.pdf

If you go to the Radio Society of Great Britain's main page at http://www.rsgb.org/ the RSGB are intent on 'selling' their 'spectrum defence fund' to the membership, all fair and good, but the information on changes to satellite frequencies on 10GHz are hidden away on the 'members only' pages. Shocking!

This is the header of the article in the members-only section...

RSGB responds to Ofcom WRC
consultation The RSGB has
responded to Ofcom's
consultation on World
Radiocommunication Conference
by submitting a detailed response

This doesn't appear to be 'big news' at all.

The actual article proper is indexed at..
http://www.rsgb.org/membersonly/gb2rs/leadhead.php

Give it a try, but I'm not sure it will work for non-members.

Topic: 3186 Message: 3187

Ofcon? - yet another nail in the coffin of amateur radio.

For those who's first language is not English, Ofcom is the body that is *SUPPOSED* to represent amateur radio in the UK.

'Con' is short for 'confidence trickster' = cheat ... ergo, Ofcon.

Selling off the spectrum while at the same time allowing a drastic dumbing down of the rules *WILL* bring amateur radio down to 'chicken band' level.

Sell your rig - run out and buy a walkie talkie - do a google search for Tony Hancock's 'radio amateur'.

"This is LA8PV ... get off the air ... this is *MY* !!! MAYDAY" ...

Subject: [eu-amsat] OFCOM in the UK plan to sell off part of the 10Ghz satellite band.

Hi group.

I discovered some of this material on the RSGB website today.

Nice to know that OFCON (pun intentional!) are fighting in our corner by trying to sell off yet another valuable resource.

To be fair though, their mandate is to maximise the financial return from the radio spectrum, and therefore we cannot even compete.

See..

http://www.rsgb.org/spectrumforum/pdfs/consultations/08_10_30_low_power_licence_exemption.pdf

http://www.rsgb.org/spectrumforum/pdfs/consultations/07_09_17_Joint_Response_to_Ofcom_10_GHz_proposal.pdf

http://www.rsgb.org/spectrumforum/pdfs/consultations/07_02_08_Feb-2007-Joint-10-40GHz-reply.pdf

If you go to the Radio Society of Great Britain's main page at http://www.rsgb.org/ the RSGB are intent on 'selling' their 'spectrum defence fund' to the membership, all fair and good, but the information on changes to satellite frequencies on 10GHz are hidden away on the 'members only' pages. Shocking!

This is the header of the article in the members-only section...

RSGB responds to Ofcom WRC

consultation The RSGB has

responded to Ofcom's

consultation on World

Radiocommunication Conference

by submitting a detailed response

This doesn't appear to be 'big news' at all.

The actual article proper is indexed at..

http://www.rsgb.org/membersonly/gb2rs/leadhead.php

Give it a try, but I'm not sure it will work for non-members.

You where probably inspired by this article? "those who are still unhappy with that" probably the same folks who are beleiving Elvis is
still alive.

http://news.nationalgeographic.com/news/2009/03/090311-pluto-planet-illinois.html

"Go, Illinois!" said planetary scientist Alan Stern, principle investigator for NASA's New Horizons mission to Pluto. Scientist are always
better off shutting their mount this was often also noted on AMSAT-BB. Someone says genius is often the first step to craziness...i can
understand the glamour will be a bit less when you send a probe to check a solar system garden dwarf instead of a planet.

There is even a flat earth society where folks are discussing "This theory" on their forums it is in UK "Madness has no boundaries" but for

6$ you can have your own certificate as ridiculous it look likes i will ordered one "Ridicule never kill". Who will be the first Pluto
planet defender? Could be Mr Stern (Any relation with Howard?) can agree about this other Pluto as there is world-wide consensus on this
one:

http://www.whattofix.com/images/PlutoCartoon1.jpg

The Flat earth society
http://www.theflatearthsociety.org/cms/

I don't know it the AMSAT-BB censor in chief will let this one pass...but it is cross posted to eu-amsat too

What is the difference between these pictures and those sent by SSTV?

Only serious business instead of amateur stuff... Again amateur radio apparatus is left on the extreme right lane and probably soon in the
ditch if the ISS amateur radio apparatus is not put back in service soon! I asked this question about an hundred times: why they don't put
the ISS cross band repeater on? It can run unattended and there is no risk the batteries get down as those in the camera. It will also send
the QRP'er away off the other sat as the ISS repeater is very very easy to hear and work too.

Great promoting asset collecting floating dust in space.

Hi Mark

I got the answer that i was looking for in years but AMSAT-BB does not let him pass read they censored it...

Another try as your pass and mine not that's definitively a shameful and arbitrary censorships

For the record just look at the answer given by Miles and you will agree with me that nothing very positive came out and is it a problem to
have the situation openly disclose? even if it seems to hurt your thin skin...

You are right Vincent: "RE:This amateur has had enough of amsat-bb censorship"

It is hard to give an open public reply as AMSAT-NA anti democratic organization who is begging for money along side the streets is
blocking my messages on AMSAT-BB exactly as it was as in the former USSR communist regime so often criticized in the USA as not respecting
the freedom of speech and the human rights charter.

Double standard group or nation? i cannot tell for sure for one of them but for the other one it is so obvious that i still don't
understand why some are sending money to a so irrespecfull group managed by a lot of poor souls and poor individuals.

Just for the record i asked why the amateur radio equipment was not put in use on ISS and Miles reply due to an over-heating issues when
the cross band repeater was ON even when a fan solution has been proposed this solution was turned down??? If it is what you called not
being positive your'e right but i cannot transform a negative affair in a positive one even if it seems to hurt some offended virgins with
thin skin...

Why blocking me from AMSAT-BB? There no one with enough guts to answer me directly are to too coward or they agree in silence afraid of
retaliation as Miles wf1f experience not too far ago for having tell the plain truth about SAREX? Who in fact is an international
organization funded internationally.

If someone does not step up and start complaining against how AMSAT-NA is refraining and the not respecting the freedom of speech of some
individuals from the supporting international countries should i escalate this to this level?

I always refrain to use radio to discuss administrative and general AMSAT-NA politics over the radio but if all agree i can surely follow
your suggestion. I think as many readers you don't understand my point. What i'm telling when i said "Only serious business instead of
amateur stuff..." is the quality of the up to date technology available aboard ISS make's amateur radio looks like outdated technology when
we compare ARISS contact by amateur radio and ISS digital HI-FI TV broadcast.

The pictures put on twitter cannot be compared to the quality of those sent years ago by SSTV and again i don't say that we should get rid
of amateur radio aboard ISS but what we see is that the potential is not fully put in use and instead of promoting amateur radio from ISS
we only watch commercial stuff (Serious stuff) coming from ISS when more and more ISS school contact are made on NASA Channel where there
is a lot more of visibility than the amateur radio ARISS contacts made on amateur radio.

BTW i'm not complaining about the internet but i'm complaining about how AMSAT-NA is resctricting the freedom of speech on the internet of
those who are on AMSAT-BB under false pretension that they have the right to do anything as they own this AMSAT-BB "PERIOD".

Anyway when it's time to implement some sort of censorships there is always a lot of good explanations given to try to make's the crowds
believe they are doing it for them in a way to pleased them and that is was for their common benefit.

Yahoo group: eu-amsat
Date: 2010-02-07 11:12:41 UTC
From: Al
Topic: 3195 Message: 3195

Hi group

What am I babbling about? Well, those are the only remaining six flights in the space shuttle (STS) manifest. STS-129 was due for launch today, but got scrubbed by cloudy WX. It may launch tomorrow. STS-134 is the last flight scheduled for STS. It's planned to fly in the late Autumn. Realistically, I expect that to slip into next year.
After that for US manned spaceflight? Zilch. Only Soyuz.

The Shuttle has no replacement, a shocking state of affairs, but the simple fact is that NASA was/is underfunded for it's needs , so to continue to pay to fly the shuttle, development of a new launch system was effectively placed on the back burner, until they came up with ARES1 AKA 'the Stick', a lousy bodge of a thing IMHO which is going nowhere. The recent budget cut by Barack Obama's administration has only made matters even worse for an ailing organisation. From late Autumn, if NASA's manifest goes to plan, and I personally rate that as very unlikely, Soyuz will be the ONLY way to get humans into space.

Eventually, SPACEX *may* provide an alternative, but that's quite a bit away yet. Their DRAGON9 vehicle and pressurised DRAGON capsule *could* be used to put humans in space and deliver them to the ISS, but it's nowhere near ready yet. Spacex is an amazing 'can-do' company but they have only a couple of sucessful launches of their small Falcon1 launcher under their belt. They *DO* have NASA funding for several NASA missions planned on the Dragon9 but the fact remains that DRAGON9 has yet to fly. Dragon 9 with it's cluster of nine smallish rocket motors in it's core stage borrows more from the Soyuz concept than the Shuttle, but it should do the job. One thing is for sure, NASA will be buying their vehicles from the private sector in future, rather than developing their own. When you think about it, this is a sensible way to do business. The 'NASA way' is no longer affordable.
The next few years should be very interesting ones in the space business.

Hello Al

STS-130 scrubbed today, see
http://www.nasa.gov/mission_pages/shuttle/main/index.html

Following an excerpt from NASA's Space Calendar:

Feb 08[corr] - STS-130 Launch, Space Shuttle Endeavour, Node 3, Cupola, International
Space Station
Mar 18 - STS-131 Launch, Space Shuttle Atlantis, Multi-Purpose Logistics Module,
International Space Station
Apr 02 - Soyuz TMA-18 Soyuz FG Launch (International Space Station 22S)
Apr 28 - Progress M-05M Soyuz 2-1a Launch (International Space Station 37P)
May 14 - STS-132 Launch, Space Shuttle Atlantis, International Space Station
Jun 14 - Soyuz TMA-19 Soyuz FG Launch (International Space Station 23S)
Jul 29 - STS-134 Launch, Space Shuttle Endeavour, International Space Station
Sep 16 - STS-133 Launch, Space Shuttle Discovery, International Space Station

I was able to test an AG-35 preamp and the internal FT-847 preamp (UHF) over the past week end only to discover that even with the AG-35
mounted at the antenna there was a 2 digit S meter reading with the AG-35 but regarding the Q signal quality the margin was again in favour
of the AG-35 but the difference is not as noticeable only at LOS and AOS where the FT-847 preamp was hearing only noise the AG-35 return a
Q3 signal without any S meter reading.

The test has been conducted on a 24 elem linear UHF yagi on a 100' line of LMR-400. Could be a 45' of 7/8 heliax keeping the preamp at the
antenna will give me more S meter reading at AOS and LOS but this will have to be tested.

I think the more gain you can achieved with your antenna the less you need a preamp?

Could be old reheated stuff for some but it make's theory a bit less shinning compare to practice or the real world experience.

IMHO there is a time where big formulas figures does not equal overall signal strength received. In our LEO world even if we where able to
hear a faint signal 200 db under the noise floor we will ended up calling CQ forever.

This is illustrated very well with this real story where a man was asking God what the eternity mean for him? He answer for you mortal it
is 1 second. He asked God again how much 1 million $ is representing he answer one cent.

The guy just ask God give me one cent God answer back yes wait a second.

Theory VS practice.

"ANS is a free, weekly, news and information service of AMSAT North America,
The Radio Amateur Satellite Corporation"

Is this "FREE" mean that i will have to pay soon for it or it is a liberty of speech
liberty respecting group?

Could be N1JEZ MICHAEL E SEGUIN who's living in Burlington Vt not too far away fron grid
FN36KA can give us some enlightening answers?

"ANS reports on the activities of a worldwide group of Amateur Radio operators" Is this
mean AMSAT-NA is representing or acting as it was
representing?

The activities of a worldwide group of Amateur Radio operators"... Is the "AMSAT-NA BoD
Adopts Acceptable Use Policy For AMSAT Mail Lists
new politics is validating their censorship process when Dee is writing: " IS ALSO
REPORTING THE ACTIVITIES OF A WORLDWIDE GROUP OF AMATEUR
RADIO OPERATORS" It is as per the AMSAT-NA POITICS or as per the United State of America
constitution?

If AMSAT-NA is promoting " THE ACTIVITIES OF A WORLDWIDE GROUP OF AMATEUR RADIO OPERATORS"
It is probably also endorse by Alan Kung, BA1DU
Project Manager (www.camsat.cn) as it seems to let the New Chinease amateur radio satellite
group taken upon by AMSAT-NA as their fiirst
primary source of international media reporting source.. I'm not too convince the Chinease
government authorities will be very pleased with
this or could be their struggle and fight against GOOGLE presence in China is bottom line
inspired by the "AMSAT-NA BoD Adopts Acceptable
Use Policy For AMSAT Mail List"...read a lot of BS.

Curious world where the US debt is mostly is held by China... I will not feel too much well
when my mortgage creditor is in China and when

i'm telling them they are not respecting the freedom of speech of their own people... i'm feeling a lot less well if China can ask the US
for a Chinease bank salvage plan...? I'm asking myself could the AMSAT-NA BOD greath wisdom can give us the solution!
Are we in a fony balloney situation here? could be we can rely on CNN situation room to have an objective point of view...?

I know it is OT but wow can a free human who is aslo an amateur radio satellite operator can react when he see the "AMSAT-NA BoD Adopts
Acceptable Use Policy For AMSAT Mail Lists"? He's is a "sheep" a "slave" or a free man? or _____ add your own words here.

P.S. Gunther still never reply to my question ask on my web page: www.qsl.net/ve2dwe
and those who think i'm against my US friends will be happy to know that i will have questions soon for some of our ARISS and RAC AMSAT-NA
and ARISS Canadian representative! and BTW if only 50% shared my views it take's only one more to elect a new president... I still feel
free...

As one of my US reader wrote " in any supposed to be empire there is also some who don't share the views of the so called empire regulated
or not by the military"

End of the P.S. and Happy Valentine day to all of our dedicated womens especially to Joanne Maenpa K9JKM and Rosalie White K1STO and Martha
Saragovitch and Emily E Clarke N1DID

Yesss it's works!!
I've just worked HO-60 with Software
And YESSS No hardware TNC used !!

WISP AND MIXW did all the Action via virutal VSPE connector and soundcard.

For more info check up this link
http://st2nh-blogger.blogspot.com/2010/02/pacsat-with-out-hardware-tnc.html

http://st2nh-blogger.blogspot.com/2010/02/wisp-keying-mixw-direct-via-virtual.html

Thanks for Mr.Allan ZS1LS for Help and information and for his software
messages via HO-68 BBS I received today by software tooo.

Thanks to Mr.Mineo Wakita - JE9PEL
For the new page to his wounderful WISP site.
http://www.ne.jp/asahi/hamradio/je9pel/wispvspe.htm

And for Sure a big Thanks for my friends;

Pete -WB2OQQ
Mike -Dk3WN
Alan -WA4SCA

3202. If you could CAT only one radio, which would it be: uplink or downlink?

Yahoo group: eu-amsat
Date: 2010-02-20 22:13:20 UTC
From: g3wie
Topic: 3202 Message: 3202

Hello all

I'm moving slowly but steadily to having a linear sat station. I have two radios I will use via transverters for V and U - an Elecraft K2 and a Yaesu FT-747. After some tests, it looks like the 747 CAT is very likely to be defective (I will post separately in case anyone has any ideas), so I'm going to end up with one radio which I have to tune by hand. So my question is which radio should I control? I have read the "one true rule" and have some ideas of the potential problems.

My current feeling would be to control the uplink, regardless of U or V. This on the basis that my transmitted signal should stay at the same frequency as far as the satellite is concerned so I shouldn't walk over anyone else's qso. What advice do you have? (I would add I haven't made a satellite qso yet so my suggestion is - ahem - a bit theoretical)

Of course, Murphy has arranged things so that I have wired the station, and written the sequencer software, assuming the 747 is always the uplink. I've also fitted a SDR to the IF of the (downlink) K2 so I can see what's going on +/- 20KHz around my frequency, and fitting that's going to be a lot harder with the 747 which has a first IF of 47MHz according to the manual

But then no-one said this was going to be easy...

Chris g3wie

3203. Problems with FT-747 CAT

Yahoo group: eu-amsat
Date: 2010-02-20 22:23:25 UTC
From: g3wie
Topic: 3203 Message: 3203

A long shot, but has anyone had experience with the CAT on this rig (or perhaps with similar Yaesu rigs)?

Rather belatedly, I thought I'd check that the CAT on my two rigs (Elecraft K2 and Yaesu FT-747) worked ok. The K2 is fine, but the 747 does not want to play. If I send it a command, an icon that says CAT flashes on the display for a second or two, but the command isn't executed. If I request status, there is no activity on the serial output from the 747, it stays solidly at +5 volts on my oscilloscope.

I looked in vain in the service manual hoping to find a factory reset function to try. There's not much information on the web beyond some mods and faults (CAT isn't one of them). No-one in the FT747 yahoo group has any ideas. If I can't fix it, I'm down to one CAT-cpntrolled radio - see my other post

This is also my operational advice and I agree with you. All OPs who are
using the
"one true rule" tunes down and up again in the passband. This rule does
not work.
Longer QSO's I had on a linear transponder were without this rule, just
with tuning
the uplink only. Linear transponders are not easy to operate as
FM-repeaters, but
it could be easy without such "rules".

I am encouraged by your practical advice. I will start to pull the wiring apart. I shall have to make it so that either rig can do anything or I will miss something else

>
> Super Chris, you are a "DO'er" and not just an asker: "What is the
> best?... "

Well yes I am, but there is the danger that I spend all the time "DO'ing" the building and never get on the air. That is what happened with AO-40. I was just starting to test my 2.4GHz rx when it stopped working.

3206. Fixed Re: Problems with FT-747 CAT

Yahoo group: eu-amsat
Date: 2010-02-24 20:18:26 UTC
From: g3wie
Topic: 3203 Message: 3206

I finally got to the bottom of the problem and the rig now accepts commands and returns status with MixW running in windows.

There is a problem with the hardware in this rig. The CAT serial output (SO) from the CPU goes through an emitter follower BUT it has NO load resistor from emitter to ground. If your TTL-RS232 adapter doesn't have such a resistor, or present a similar dc load on this signal line, then the serial output from the 747 will stay at +5volts as there is nothing to pull the signal down. I fitted a 5K6 resistor from SO to ground, and now I see signals on the SO line of the CAT connector. MixW correctly reported the dial frequency as I changed the frequency on the 747.

You can fit the resistor outside the rig if you want, just connect it between the SO (pin 2 of the DIN connector) and Ground (pin 1 of the DIN connector) in parallel with the wiring that runs to your adapter

Now I just have to get the linux software working....

Hi Nader and group,

I hate to be the one to throw a spanner in the works, but $360,000 is pitifully short of the mark for the cost of a launch to HEO. Time to 'get real'.
This is why I think that a major shift in thinking is required. Molniyas are just not on the cards any more.

Perhaps David Bowman's MEO concept needs to taken off the shelf, dusted down, and examined in more detail. A few, perhaps three, (relatively) low cost (and simple... sorry satellite builders!) CUBESATs could do surprisingly useful things for the satellite community, even for the DX'ers, and kick-start interest again in what AMSAT can do for the users. I'm thinking 8 inch cubes for decent power generation. I urge you to do the sums yourself and see what is possible. Don't leave everything to others.

Although some see securing a launch as a stumbling block, or a means to get from LEO to MEO as difficult, the Russians already DO launch from Plesetsk into VERY useful near-polar orbits of 1000Kms and higher. That may be one way to get to a useful orbit, but one thing is certain.... the CUBESAT format utterly is useless for MEO. You simply need more electrical power for a linear transponder than the measly couple of watts a CUBESAT could supply.

Those members who are old enough to remember the fun that could be had with the old RS birds will know where I'm coming from.

Put some appropriate numbers into your computer tracking program and *then* tell me it doesn't make sense.

For sure, this type of project would piss off the builders mightily because it's not 'exciting' enough, but should that really be a consideration? I don't think so. It's what the users want that *should* matter.

Dear Al

Then you can also remembering for AO-10 and AO-13 and the fun we had
with long and stress less DX-QSO's.

If I would have any doubts about the progress of P3E and its launch,
I would be retired from AMSAT-DL. Lets look forward for the results
of the DLR/AMSAT-DL project (see my last report).

Fine Thomas, all understood, but the situation for AMSAT has changed dramatically since Arianespace started charging commercial rates for amateur radio launches, just like every other launch agency I know of.

I personally considered the Molniyas to be ultra-boring for the very reasons you seem to have liked them. We don't all like the same things.

Some people like being busy, rather than having no real operating challenge. I'm one of them. I welcome the 'stress' as you call it. Stressless is boring. Your mileage I'm sure will vary. The Molniya's offered somewhat more of a technical challenge, (only somewhat), but nothing much in the way of an operating challenge. In fact operating them was err well... boring! Nothing much to do. My personal preference for LEO's apart ... and this forum is about neither of us... but instead ALL of us, the fact remains that launch costs are driving many things well beyond the reach of AMSAT funding, and it's simply *not* the case that everyone wants Molniyas. Even if we did, can we afford them? ... or even one of them? CUBESATS really are completely useless as a platform for a linear transponder, so other opportunities need to be sought, before the Universities declare the prime satellite sub-bands to be out of bounds to 'real' amateur radio satellites... ones with transponders on board.
That worries me far more than getting P3E into orbit.
MEO could be 'it'.

AMSAT-DL is fully aware of this fact. We will "box" P3E into orbit. We have
invested too much time, sweat and money into this project only to get
surplus.
I'm not naive, I have an optimism for this project. But if we get surplus
(no HEO), ok ... a la bonheur. Its not a Malheur. ;-) But I would be
disappointed.

3215. RE: [eu-amsat] Re: Grab it, quick!.

Yahoo group: eu-amsat
Date: 2010-02-28 00:42:28 UTC
From: John Hackett
Topic: 3207 Message: 3215

Group,
Just to make it clear ... my comments regarding a dozen cubesats at
$30,000 a pop was of course a satirical jibe at the ridiculous! cost of launching
yet another 'me too' receive only junquesat.

That particular 'price' was quoted by NASA, soliciting 'educational' projects and their
$30,000 was considered 'cheap' ... (but not by me).

Like GM1SXX has stated time and time again, the days of the 'El Cheapo' launch
opportunities are well and truly over.

Furthermore ...

Give it another two years or so and people WILL begin to realise that GM4IHJ was
right when he warned about the University 'me too' sats taking over the amateur
satellite frequencies.

Oh by the way - don't forget Thursaday night is college night - now on the linear
satellites too - (source: The Amsat News Service) - to begin with, the first Thursday
of every month.

Thank goodness for HO-68, digital, linear and FM. Now that's !!! what we need more of.

Personally, I agree with GM1SXX - I find it a lot more 'challenging' and rewarding to
operate CW on a linear LEO satellite using manual doppler tuning ... than it was to work
AO-13 half asleep with a fully automated station ... I did both, for several years, but
much preferred RS-10 with it's CW ROBOT ... testing my skill was the challenge.

Like Al says, we're all different - but this forum is for EVERYBODY.

Hi All

Another go for Pacsat with software.
This time Wisp with Multipsk ver 4.16

Wisp Keying Multipsk via VSPE virtual connector port .
So far TX line was testing.

Wisp-->Multipsk-->soundcard

Setup
Create a Connector virtual com using VSPE software
Wisp -->com 1
Multipsk serial port for kiss --> com 1
On Multipsk TX/RX screen choose-->Packet APRS
On Multipsk TX/R screen click kiss icon.
Run a pass!
Click fill.
MSPE will send a packet to Multipsk TX/RX screen
and through the soundcard.

Again I'm waiting for a bird .

For more info and Movie see
http://st2nh-blogger.blogspot.com/2010/02/wisp-keying-multipsk.html

For my previous Wisp MixW experiments see.
http://st2nh-blogger.blogspot.com/2010/02/pacsat-with-out-hardware-tnc.html

http://st2nh-blogger.blogspot.com/2010/02/wisp-keying-mixw-direct-via-virtual.html

Hello Roberto

Wire 7 goes to a 8pol DIN connector to the HaSI-interface. This interface has nothing to do with the LVB Tracker.

Hello Trevor and group

I saw it. This is a commercial CubeSat, after QuakeSat the second.
Its a scandal that commercial firms also want to save money for their
satellite-projects, besides the universities. Its not an intruder,
they got an experimental license from FCC. This is apprehensive.

Anyway, hopefully this cube will send on 2.4 GHz in the S-Band, so
we have an additional S-beacon in orbit.

Hi Group.

Interesting that so few people in amateur radio seem to care that commercial (and 'educational') satellites are being given amateur radio band allocations by our radio union.

It's nothing new of course, but remarkably few radio amateurs appear to care, so the situation can only deteriorate. Strange that the IARU don't see these non-amateur birds for what they are, commercial programs, and are happy to allocate them amateur frequencies, generally with AMSAT giving them a further 'seal of approval' with an OSCAR number. It's like cutting our own throats really IMO.

I could understand the situation being acceptable if it was the ITU allocating frequencies, but I don't understand why the IARU, "The International *Amateur Radio* Union", are effectively signing off amateur radio bandwidth to commercial clients with a blessing via the co-ordination process. Thats a scandal IMO. Don't be too surprised and shocked then if AMSAT are frozen out of these allocations in future by commercial users.

The Federal Communications Commission are a US based commercially oriented government based organisation, not an amateur one. Rather like OFCON... oops sorry folks... I meant OFCOM, their analogue in the UK. They are both about earning money for their respective governments by selling off spectrum space. Thats worth remembering. They are not fighting for our cause. The IARU don't appear to be fighting in our corner either IMO.

If it works it will provide a way for us to get satellites with a 1500km+ apogee in just a 2U CubeSat.

With a 2U CubeSat you should have just enough solar power to support a 1 watt linear transponder. The launch/integration costs could be as low as $60,000 on say future NASA launches. That kind of figure is affordable by Amateur Radio groups.

Elliptical orbits like this also have the advantage that they burn up after a few years (I think about 27 years for a 750km perigee sat ?) thus solving the orbital debris problem.

Hi group,

Trevor says...

> With a 2U CubeSat you should have just enough solar power to support a 1 watt linear transponder. The launch/integration costs could be as low as $60,000 on say future NASA launches. That kind of figure is affordable by Amateur Radio groups.

Has anyone actually done the sums to calculate how much power is actually needed to power the transponder plus the other systems? The RF conversion efficiency of most one watt class linear transponders at VHF & UHF is poor and is probably impossible in a double CUBEsat format. The S-Band downlink will eat power. S band transmitters are notoriously inefficient.

A single CUBESAT with efficient solar cells can only supply a couple of watts of power, and a double CUBEsat wont produce twice as much, so has anyone done actual calculations to see what can actually be achieved? Bear in mind that if the bird carries batteries, quite a bit of the available power in sunlight will have to be diverted to the BCR, for the battery, so not much is actually available to operate the transponder and other systems. The Cubesat format is really not suited to linear operation. Of course were it to be a batteryless satellite, the situation changes a bit and it might then become feasible, sort of.

The triple CUBESAT volume could actually support a PICO transponder with deployable solar double-hinged panels of reasonable surface area, and power capability, wrapped around a small core, on condition that no battery was flown. Not a new idea of course. I described the concept years ago to various people. Interest factor ... zero. It is certainly one way to extract the maximum power from the minimum volume.

POPACS movie at...

http://www.youtube.com/watch?v=L0ldSWgOEjU&feature=related

Quite a clever concept really, but this one seems to be a multiple (*3) CUBESAT with a sphere on top. It's a step in the right direction, but I'm certain that quite a bit more power could be had from the triple Cubesat format by some clever engineering. The battery? No space for it. It would have to go :-)

Trevor, are you sure ? Its a big business for Colorado Satellite Services LLC.
This firm has also big investments. So they make never a gift to radio amateurs.
Or do you have other informations ?

I remember me I was in the 1990s at a AMSAT-UK Colloquium in Guildford. There was a student from the Uni who was held a session about a propulsion system on a chip. I have nothing heard about it until today, if this firm uses this technique.

Hello Al

Its a question of cooperation between the amateur radio organisations
and their government. Our USKA has an excellent cooperation with our
BAKOM, the Swiss government.

Hi Thomas, and the group.

I'm confused by your posting. This question of co-operation is relevant how?

Are you suggesting that 'co-operation' makes flyimg commercial birds transmitting in the amateur satellite segments and allocating Oscar numbers to the same commercial birds, makes them somehow into 'amateur satellites', or have I missed some very fundamental point here?

It should also be remembered that regarding Amateur Radio, the ITU and IARU in that order, have the responsibility for radio communications globally and not governments. Governments have only very limited power to allocate small blocks of certain frequencies via their communications agencies. I'm sure your country's communications agency is in absolutely no way substantially different from OFCOM or the FCC.

I'm just as keen as the next guy to see new 'amateur radio satellites', but most of the birds currently being built for use on amateur frequencies are really commercial projects or commercial technology testbeds. Are they amateur satellites? I don't think so.
YMMV.

For the relationship between the radio amateurs and the government. If the
government not allows to operate in a new frequency segment, for example
7.2 - 7.3 MHz, or the government gives commercial licences for an amateur
band (for example), then there is a bad or no relationship between radio
amateurs
and government.

If you inveigh about your OFCOM, then there is a bad or no relationship
between
RSGB and OFCOM.

> Are you suggesting that 'co-operation' makes flyimg commercial birds transmitting in the amateur satellite segments and allocating Oscar numbers to the same commercial birds, makes them somehow into 'amateur satellites', or have I missed some very fundamental point here?

My remark has nothing to do with satellites in special, only with
ham radio in general. Sorry, if I confused you.

I agree. This is also an important reason for a good co-operation
between ham radio organisations and government.

I think I remember that talk, it was possibility the Satellite on a chip talk. It was theoretic rather than practical and I don't think it has anything to do with the gas propulsion on POPACS-RR.

There was also a talk one year on ion propulsion for small satellites and that I know has been progressed further.

Of course one thing you can't do as yet in a CubeSat platform is run a software defined transponder, such as P3E will use, which would overcome the dynamic range issues of conventional transponders. They impose a significant power overhead (350mw ?) but who knows what will happen in the future. Maybe some form of foldable solar panels that could be deployed in orbit would provide the extra power ?

Topic: 3233 Message: 3233

Hi group.

This is only an idea, and it's not even mine. How to generate more power than your satellite's surface area naturally permits is sometimes the quest of the satellite builder, and especially so in the case of the CUBESAT. Fortunately the big boys have been doing just that, very successfully, for very many years.

The concept is very simple... build a barrel-like spaceframe covered in solar cells over which a slightly larger solar cell covered tube slides. The idea is analogous to the Russian Matrushka dolls but I think the Hughes coropration got there first, in space at least. Many US built COMSATS use this method to boost power generation and it works well for them. The outer solar generator is deployed once in orbit, to double the surface area... and power generation capability of the satellite. Doing things this way eats into the available volume for batteries, transponder(s) and other systems, but batteries are the cause of many satellite failures and could be dispensed with if daylight-only operations were acceptable. Furthermore, by simplifying the onboard satellite system as much as possible, greater longevity could be assured. Wouldn't please the builders, but it would sure please the users :-)

The other obvious way to increase power generation and solar-cell area is to use deployable hinged panels wrapped around a sub-sized central core, or to use flip-out panels like those used in DELFI-C3.
What a pity the amateur transponder on delfi suffered problems and was shut down. It's a satellite with many unuusual features but was rather a damp squib as far as the amateur radio operator is concerned. Maybe next time?

Attachments: 5 described; binary payloads are missing from this source WARC

OBSERVATIONS FROM NORWAY. 050320101315Z.

A HALF RHOMBIC ??.

Nah !! ... it's a V Beam.

Used primarily by the military in the 1960's for long distance point to point communications on VLF and HF.

There is no reason why HF aerial principles can't be used on VHF, UHF or even MICROWAVES. The 'aerial physics' principles are the same - regardless of the frequency used.

Only the implimentation and materials differ.

A half rhombic or 2 element V beam - (call it what you will) - can be used at VHF just as well as at HF. If carefully constructed - with a spacing of 0.25 wavelength and an apature of 90 degrees, it can be made to perform as well as a 3 element yagi - but take up less space and it will literally knock the socks! off an inefficient helically wound S.V.V.G. aerial.
(Short Vertical Vulcanised Goose) ... rubber duck, to you, Duckie. In most cases, a resonant wet shoelace will outperform most commercial rubber ducks. The 'standard' SWR being 3:1. I know certain people don't bother about the SWR and claim it belongs to the 'chicken' band but SWR is the ratio of the power of the wave travelling from the load back to the source so while a lot of people claim it it is *NOT* loss - it's definately not performing any useful work and is therefore only contributing to heating up the transmission line - which *IS* dissipating energy ... err ... loss!.

A 'rhombic' aerial is generally accepted to have at least 3 x halfwaves on each leg and provides 'gain' due to the fact of the current and voltage nodes cancelling out in the first and third halwwaves and cancelling eachother in the second ... providing directivity and a good front to back ratio - compared to a halfwave dipole.

Since the aerial I describe only has a quarter wave on each leg it's more suitably referred to as a 2 element V beam. The gain is realised slightly differently from the rhombic. In thy
e 2 element beam, the principle is the same as that of a yagi, it realises forward gain by passive phasing since the reflector is a quarterwavelength behind the director.

Different schools of thought provide different gain figures for Rhombics and V beams but it's safe to assume that a rhombic with 3 x halfwavelengths on each leg will provide 6dBd over a dipole whereas the 2 element V beam with a quarterwavelength on each leg will give a forward gain of about 4dBd and a front to back ratio of somewhere in the region of 10 to 12 dB.

Some aerial manufacturers quote some truly amazing! gain figures for their products and it must be remembered that these are almost always produced in a 'lab' using 100Mhz models on

a computer under perfect conditions. They will invariable *NOT* perform to the same specifications at your QTH unless you live in the middle of a bog on an island surrounded by sea water.

(For 7 years I did ... Gossen Island. IOTA EU 36. I currently live on Frei island. EU-56).

The vertical radiation angle for all aerials depends primarily on the height over effective ground - (which isn't necessarily the surface of the earth) - it depends on the conductivity
of the surface in question. An amp-meter measurement of the conductivity of the ground is beyond the scope of this article.

A shoulder mounted V beam.

The photos should be self explanatory.

The 'math' - (formulii, to you) - can be found in any aerial book or on the internet.

As previously mentioned - measurements from one location will almost invariably never repeat at a different location - (physics + Murphy's law) - so 'tweak' for your own QTH.

I used 10 x 3mm aluminium bar for the shoulder bracket, boom, reflector and fittings, 2 x surplus Watson FC-130 frequency counter telescoping whip aerials and a couple of Junque-box BNC's. The reflector is split into 3 pieces to conserve space when the aerial
is collapsed and you're gadding about on a bus.

The feedline is a halfwavelength of RG-58 to an IC - E92D in the shoulder bag.

Adjust the V for a perfect 1:1 match.

This aerial will kick your rubber ducky's bum.

While not quite as effective an an 'Arrow' clone this aerial *WILL* save you thousands of Pounds, Dollars, Bath, Rubles, sheep (!) in compensation for poking people's eyes out.

Mounted on my shoulder the aerial is about 3/4 wavelength over the ground and so has useful lobes for satellite operations ... and err ... you can always rotate about your own access.

An earlier OBS decribes the SATme tracking software on a mobile phone.

NOTES.

a) For portable satellite operations, if like me, you are (reasonably) concerned about poking somebody's eyes out (The 'arrow' dance syndrom) you can always use a smaller aerial.

b) Those that are old enough will recall that it was St Vitus who originally invented the Arrow 'dance'.

Here is a speech excerpt from William Shatner AKA Captain Kirk (who is born in Montreal) made during the winter olympics closing ceremony:
" As a Canadian i can pronounce Juan de Fuca without be censored" Capt Kirk is living in the US for many years now and probably having his
US citizenship. As the a phrase used in the title sequence of most Star Trek episodes "Where no man has gone before" It was too tempting to
make the association with the "Acceptable Use Policy for the AMSAT Public Mailing Lists" I think William is reading AMSAT-BB?

WRONG and false statement: "> > As put before, we are the only organization that directly supports Amateur Radio Satellites"

AMSAT-DL does
AMSAT-SA does
AMSAT india does
CAMSAT does

Please feel free to add to the list

Another American "we are the center of universe" false commenting fortunately it is more an more an exception from the rigid right wing.
What an disrespectful commenting from an AMSAT-NA representative shame on AMSAT-NA organization.

3240. RE:New digital mode ROS - Satellites ?

Yahoo group: eu-amsat
Date: 2010-03-11 03:00:13 UTC
From: Luc Leblanc
Topic: 3240 Message: 3240

From: Trevor .m5aka
Date: Sat, 20 Feb 2010 09:45:18 +0000 (GMT)

ROS is a digital spread spectrum mode but with a narrow tota occupied bandwidth. Current activity takes place on USB frequencies: 3.600, 7.053, 14.101, 28.300.

It can automatically synchronizes within a range of + -200 Hz so may be a better mode for satellite working than PSK31.

Further details at:

New amateur radio digital mode - ROS
http://www.southgatearc.org/news/february2010/ros.htm

73 Trevor M5AKA

I am planning to test the mode over satellite using two program running at the same time one on the uplink and another on the downlink.
If in the mean time someone "Out of the US) want to give it a try just contact me off list.
Thank's

From QRZ.com

http://www.arrl.org/news/stories/2010/03/04/11377/?nc=1

In mid-February, European amateurs first used a new, experimental digital mode known as ROS. On February 23, 2010 -- after FCC review of
the original documents provided from the developer's Web site -- the FCC made the following statements on ROS:

"Section 97.305 is the rule that specifies where different emission types are allowed to be transmitted on different bands. 'ROS' is viewed
as 'spread spectrum,' and the creator of the system describes it as that. We assume that he knows what he created. [Section] 97.305
authorizes spread spectrum emission types (defined in Section 97.3) to be transmitted by FCC licensed amateur stations at places we
regulate communications only on 222-225 MHz and higher frequency amateur bands. European telecommunication regulatory authorities may
authorize amateur stations in Europe to use SS on the HF bands, but this is of no concern to us. The Commission does not determine if a
particular mode 'truly' represents spread spectrum as it is defined in the rules. The licensee of the station transmitting the emission is
responsible for determining that the operation of the station complies with the rules. This would include determining the type of emission
the station is transmitting and that the frequencies being used are authorized for that type of emission."

Since that initial FCC review, several Internet sites have reported a claim -- attributed to the FCC -- that the original statements made
had been reconsidered and that the FCC view was now that "ROS cannot be viewed as Spread Spectrum and it would be encompassed within
Section 97.309 (RTTY and data emissions codes)."

When queried about this new statement, the FCC's Consumer Assistance Office stated that "[T]he information contained on the ROS Web site
was not provided by the FCC." They then reaffirmed the original statements that originated from the FCC's Wireless Bureau, which handles
Amateur Radio rules for the US.

The ARRL supports -- as one of the basic purposes of Amateur Radio -- the experimentation and advancing the technical skills of operators.
The development and use of any new mode is exciting to many amateurs, and the League encourage amateurs to experiment within the parameters
of the rules; however, the ARRL also reminds US licensees that according to Section 97.307, spread spectrum communications are only
permissible in the US on frequencies above 222 MHz.

HO-68 Schedule - 14-21 Mar 2010

Subject: [amsat-bb] HO-68 Schedule - 14-21 Mar 2010
From: "Alan Kung" <alankung@xxxxxxxxxxxxxxxxx>
Date: Sat, 13 Mar 2010 00:07:41 +0800

Hello all,

I got a lot of responses about problem of digital mode
through HO-68. The main problem is that Packet communication
is often interrupted by voice. We are trying a new schedule
in this week, voice and packet operations will be separated
by the schedule, of course, this just depends on the hams'own
discipline. If you have any comment and suggestion, please
let me know.

Thanks Thomas.

William has devoted a lot of his time, money and energy into his linear transponder project. He's already demonstrated the transponder unit at JARL and I think his next major demonstration venue will be in China. You can also see his transponder in action on Youtube. Try typing in 'PE1RAH or 'transponder'. His earlier PICOSAT transponder design was hand-soldered but the new LE-005 model is reflow-soldered.

3247. HO-68 & APRStt

Yahoo group: eu-amsat
Date: 2010-03-22 15:39:25 UTC
From: John Hackett
Topic: 3247 Message: 3247

Hello Alan & fellow satellite ops,
I'm wondering if there'd be any negativity if APRStt were utilised on HO-68 when the transponder is in 'digital'' mode?.

As you probably know, APRStt is WB4APR Bob's concept for utilising 'any' DTMF rig on APRS, a tactical real-time information system using UI packets.

What may be - (as yet) - lesser known is the short-form version of APRStt, designed specifically for SPACE communications ... (see attached note).

I believe that while potential newcomers won't initially have equipment for a full digital station they *WILL* probably have a handheld rig with a keypad. My thoughts are ... anything that can promote amateur radio satellites must surely be useful - particularly things aimed at our SMS-fingered youth ... as opposed to the rickety old telegraphers like La2qaa.

Opinions are solicitated Gents.

If this *IS* of interest, further reading is available by Googling APRStt.

73 John. <la2qaa@...>

.....

Space APRStt

APRS DTMF-to-APRS PROTOCOL 10 Oct 2002

WB4APR

APRStt is the specification for Touchtone applications of APRS. It allows anyone with an HT to use his DTMF pad to enter APRS positions, messages and other data. Thus EVERYONE in ham radio can communicate by APRS, not just those with APRS HT's.

Although the Terrestrial application of APRStt with its well defined voice repsonses will revolutionize APRS and allow everyone to participate, a shortend modified version is necessary for Satellite applications. This is because a satelllite can hear everyone in the USA or Europe at once. Thus the ability to combine multiple transmissions into a callsign, Position, and message is impossible. The entire data from one station must be sent in a single 16 digit DTMF string. This is the typical size of DTMF memories in most HT's.

Therefore the following SPACE version of APRStt is being developed:

FUNDAMENTALS:
1) All protocols must fit into 16 digits
2) All protocols must end with the "D" key
3) All SPACE protocols must have a valid CHECKSUM
4) Calls are HASHED, meaning a 6 digit decimal callsign equivalent.

The best small satelllite application of SPACE APRStt is to have a simple DTMF decoder on the satellite uplink and then for the satellite to convert the DTMF to the SPACE-APRStt equivalent AX.25 packet on the downlink. Then all APRS stations in the footprint of the satellite and the worldwide APRS internet linked system of AX.25 receivers will receive the data. If the satelltie is DTMF only, then all it has to do is regenerate the DTMF on the downlink and let a SPACE-APRStt ground station convert the packet for injection to the worldwide APRS internet system. FOllowing are the initial definitions of SPACE-APRStt formats:

POSITION FORMAT: The following is the proposed

```
16 digit DTMF Packet
---------------- ----------------------------------------
AccccccBhaaalllD CCCCCC>APxxxx,WIDE:=AAA0.00N/LLLL0.00W$
```

Callsign begins with DTMF "A" and callsign (cccccc) (924277=WB4APR)
Then DTMF "B" indicates POSITION Follows:
Where h is hemisphere quadrant N,S,E,W and 100's digit of LONG
where aaa is 3 digits LAT and ooo is 3 digits Long (nearest 10 mi)
Ends with DTMF "D"

MESSAGE EXAMPLE:

```
16 digit DTMF Packet
---------------- ----------------------------------------
AccccccC1234567D CCCCCC>APxxxx,WIDE::ALL :1234567
```

Which is a message to ALL from cccccc containing a 7 digit message. I have defined MANY pre-defined messages including ARRL radio grams etc... so this is not much of a limitation...

3248. Re: [eu-amsat] HO-68 & APRStt

Yahoo group: eu-amsat

From: Thomas Frey
Topic: 3247 Message: 3248

Hello John

Is "APRStt" APRS via DTMF and not via Packet Radio ? Isn't it ?

To prevent confusion: If HO-68 is in FM mode, you can send any tones
you want. Voice, DTMF, SSTV, Packet Radio ... what you want. You only
have to declare the communications protocol.

HO-68 has a PacSat-Mailbox for Packet Radio. Is the digipeater on,
you can see it in the telemetry line as "D:1".

I hope I have understood your mail correct.

From: John Hackett
Topic: 3247 Message: 3249

You're quite right Thomas,
FM would be the appropriate mode for DTMF tones.

I imagine the SPACE version of APRStt might be of interest to potential younger newcomers since it is they who are usually interested in and most competent on small keypads like those found on mobile phones and handheld VHF/UHF transceivers.

I imagine SPACE APRStt would be a useful entry level mode on HO-68.

As you'll know, DTMF tones are used extensively in commercial communications.

I understand John. If you can send DTMF _and_ CTCSS (67 Hz) at the
same time with your TRX, then you can use APRStt via HO-68. Via AO-27
and AO-51 it will work. This sats have no activated CTCSS tone squelch.

From: John Hackett
Topic: 3247 Message: 3251

Hello again Thomas,
Yes, I think it would be accepagble to send DTMF on HO-68 ... I'm awaiting Alan's comments. However, I'm unsure about AO-51.

I did ask Drew Glasbrenner a long time ago about D-Star - at the time he said it would be frowned upon but that AO-51 'could' be switched into a mode suitable for testing D-star if there was enough interest - (it turned out there wasn't).

As far as I know, Luc was the only station testing D-Star on AO-51. We'll have to wait for OUFTI-1 from Belgium in October 2010 for a dedicated D-Star satellite.

It might be interesting to try DTMF on AO-51. WB4APR Bob's 'SPACE' APRStt is such that it allows for a 16 digit DTMF 'burst' containing callsign and approximate position - (or other
'short' message with truncated callsign).

Do you know if this would be acceptable on AO-51 Thomas? - I'll bat this over to KO4MA as well.

(Your comments appreciated Drew).

As I mentioned previously, it might be an entry-level way for the SMS- toting/small keypad newcomersto promote satellite operating on small cubesat missions since they won't have sophisticated stations to begin with - but they *WILLO* almost certainly have a handheld with a keypad.

I'll let you know what Drew says.

73 John. <la2qaa@amsat.org>

Theoretically DTMF should be possible. Packet Radio without CTCSS is
also possible.
Its a technical matter.

> However, I'm unsure about AO-51.
>
> I did ask Drew Glasbrenner a long time ago about D-Star - at the time

> As far as I know, Luc was the only station testing D-Star on AO-51.

D-Star is another story. You can classify D-Star into a digital mode
with a data stream and DTMF into an analogue mode with 2 tones.

D-Star via AO-27 works, see "AO-27 does D-Star" on www.ao27.org. But AO-51?
This is also a technical matter.

> We'll have to wait for OUFTI-1 from Belgium in October 2010 for a
> dedicated D-Star satellite.

The inaugural Vega launch with the CubeSats is at 31 December 2010, see
http://www2.jpl.nasa.gov/calendar/#1012

>

Unofficial not, there is too much QRM. Or deep in a night you can
start such an experiment. Official per schedule yes. But is there
the same interest for APRStt as for SSTV ?

Hmm... I'm not a psychologist and its fine, that you make headaches
about this theme. But youngsters are also open for "new action". The
keypad on their handy is an "old hat". :-)

Hi Group.

I can't imagine there could be any genuine objection to sending DTMF over FM satellite so long as it' carrier the sender's ID in the message string. After all, DTMF already used to control some amateur repeaters and is a standard control code in widespread use in the telecomms industry. It's a narrowband mode, using audible tone pairs, and shouldn't cause problems on an FM transponder.

I'll leave the matter of whether or not such a signal requires a CW ident also, to others to answer. DTMF is one of the most common control code systems in general use globally, and as such, it can't be considered in any way to be a secret code or cypher.

Over to you, guys.

Oh yes Al, you are absolutely right. In our licence agreement is
defined, that we have to send our callsign after a period of time.
With only DTMF this is not possible. This problem exists by the
German Cubesat COMPASS-1. For me its not allowed to send a Morse-ID,
whether manual nor automatic.

But technically DTMF over a FM-Repeater without CTCSS is not a problem.

It was not possible at that time on AO-51 in the standard FM mode as data cannot pass through it. On AO-27 it was possible. Just check my
web page (www.qsl.net/ve2dwe) i was able to hear my own downlink in between standard FM transmission but DSTAR and FM just not behave too
well on the same chan nel as they interfere a lot as it is heard as noise by standard FM receiver and those trying to transmit over it
degraded a lot the DSTAR signal.

It will be interresting to have AO-51 configure in a some sort of mode to have DSTAR transmissions enable?

Yes Thomas,
Drew left the group quite a while ago, immediately after he flamed me and accused me of constantly criticising Amsat and contributing NOTHING.

(Luckily, a couple of past Presidents are of a different opinion - as shown by the wooden plaques for past contributions to the organisation).

Perhaps he had trouble distinguishing between 'constructive' and 'destructive' criticism.

Most organisations thrive on constructive criticism but we've seen on several occasions it doesn't appear to be welcome in the last couple of years in Amsat.

It's not a problem though - I'm too old to bother about their bickering.

Fair comment re: the youngsters but sometimes things can be *TOO* complicated to generate interest for newcomers - and remember Thomas, they're not all university educated - IMHO amateur satellites ought to be for EVERYONE - not just the elite few.

(A personal opinion).

Thomas,
You said ...

>Oh yes Al, you are absolutely right. In our licence agreement is

>defined, that we have to send our callsign after a period of time.

>With only DTMF this is not possible.

On the contrary Thomas, I proposed using WB4APR's *SPACE* APRStt ... which is specifically designed for satellites and uses a truncated (shortform) callsign in every transmission - comprising of a 16 digit 'callsign' + position ... thus ...

A123456Bh123123D

Where ...

A = callsign follows
123456 = callsign as per mobile phone keypad
B = Position follows
h = geographical quadrant, N, S, E, W (north, south, east or west with 3 digits latitude and 3 digits longditude).
D = end

Since most handheld transceiver have a DTMF keypad containing 16 digit memories a single push of a button will transmit a short message.

As Al has already stated, since commercial instances use DTMF identification both in space and terrestially it is highly unlikely that such a system would be deemed illegal.

3259. RE: HO-68 & APRStt

Yahoo group: eu-amsat
Date: 2010-03-24 00:15:32 UTC
From: John Hackett
Topic: 3247 Message: 3259

Certainly! Bob,
I'll let you know if Norbert replies.

I also posted the following to the EU-Amsat group.

Group,
I am informed by Bob, WB4APR, the founder of APRS that the latest *space*

APRStt has the callsign and position reversed from that which I quoted previously.

I believe the position in the 'latest' version can be a bit confusing.

Therefore, I'd suggest the following as an alternative.

BhaaaoooAccccccD

Where B is "position follows", h is "quadrant", N, S E or W, aaa is "most significant digits
of longditude" ooo are "most significant digits of latitude", cccccc is callsign and D is "end of string".

That is ...

B / quadrant / longditude / latitude / A / callsign / end of string

As an example ...

My location of 7 degrees east, 63 degrees north, with the callsign of LA2QAA.
would be ...

Be007063A522722D

Eventual ambiguity can be figured out from a combination of callsign and position.

If 'east' is quoted as the longditude quadrant - for an LA callsign the latitude will obviously be north - so an 'n' is not required.

That will give the 16 digits for a DTMF memory.

Sometimes confusion *MAY* occur with truncated callsigns but WB4APR suggested
a webpage where initial 12 digit callsigns could be stored.

These CANNOT be ambiguous or misconstrued.

1st digit = number key.
Second digit = letter key ... A, B, C or D.

So that LA2QAA would be 5C2A207B2A2A

2 + 0 because it's the figure 2 with no letter following the number.

The above is a *suggestion* only.

From: Mike Rupprecht
Topic: 3240 Message: 3262
Attachments: 2 described; binary payloads are missing from this source WARC

All,

today I tried to experiment with ROS over FO-29. It was not successful.

First of all, the sync time (4 seconds) seems a little bit too short. If you don□t know where exactly your signal is you have to adjust the uplink frequency very fast before the transmission starts.

If you missed the sync sequence you can□t decode the signal. It makes no sense to transmit a lot of text □ this needs too much time and if you are not synchronized you will see only wild characters on the screen.

I could read two times my own call but after a one or two seconds I lost the sync. For my understanding it□s possible to synchronize the starting sequence within +/- Hz. But it□s not possible to do that during a transmission (like a AFC).

The VHF bandwidth is exactly 1500Hz. You can see some screenshots on my SatBlog http://www.dk3wn.info/p/?p=13368

It was worth a try.

73, Mike

Betreff: [eu-amsat] RE:New digital mode ROS - Satellites ?

From: Trevor .m5aka
Date: Sat, 20 Feb 2010 09:45:18 +0000 (GMT)

ROS is a digital spread spectrum mode but with a narrow tota occupied bandwidth. Current activity takes place on USB frequencies: 3.600, 7.053, 14.101, 28.300.

It can automatically synchronizes within a range of + -200 Hz so may be a better mode for satellite working than PSK31.

Further details at:

New amateur radio digital mode - ROS
http://www.southgatearc.org/news/february2010/ros.htm

73 Trevor M5AKA

I am planning to test the mode over satellite using two program running at the same time one on the uplink and another on the downlink.
If in the mean time someone "Out of the US) want to give it a try just contact me off list.
Thank's

From QRZ.com

http://www.arrl.org/news/stories/2010/03/04/11377/?nc=1

In mid-February, European amateurs first used a new, experimental digital mode known as ROS. On February 23, 2010 -- after FCC review of the original documents provided from the developer's Web site -- the FCC made the following statements on ROS:

"Section 97.305 is the rule that specifies where different emission types are allowed to be transmitted on different bands. 'ROS' is viewed as 'spread spectrum,' and the creator of the system describes it as that. We assume that he knows what he created. [Section] 97.305 authorizes spread spectrum emission types (defined in Section 97.3) to be transmitted by FCC licensed amateur stations at places we regulate communications only on 222-225 MHz and higher frequency amateur bands. European telecommunication regulatory authorities may authorize amateur stations in Europe to use SS on the HF bands, but this is of no concern to us. The Commission does not determine if a particular mode 'truly' represents spread spectrum as it is defined in the rules. The licensee of the station transmitting the emission is responsible for determining that the operation of the station complies with the rules. This would include determining the type of emission the station is transmitting and that the frequencies being used are authorized for that type of emission."

Since that initial FCC review, several Internet sites have reported a claim -- attributed to the FCC -- that the original statements made had been reconsidered and that the FCC view was now that "ROS cannot be viewed as Spread Spectrum and it would be encompassed within Section 97.309 (RTTY and data emissions codes)."

When queried about this new statement, the FCC's Consumer Assistance Office stated that "[T]he information contained on the ROS Web site was not provided by the FCC." They then reaffirmed the original statements that originated from the FCC's Wireless Bureau, which handles Amateur Radio rules for the US.

The ARRL supports -- as one of the basic purposes of Amateur Radio -- the experimentation and advancing the technical skills of operators.
The development and use of any new mode is exciting to many amateurs, and the League encourage amateurs to experiment within the parameters of the rules; however, the ARRL also reminds US licensees that according to Section 97.307, spread spectrum communications are only permissible in the US on frequencies above 222 MHz.

Group,
Anyone wishing to suggest ways of improving our group is of course very welcome to do so.

IMO starting an additional group - unless it was a 'specialised' group - would only serve to split the ranks ... however, that being said, but this group is a FREE forum and people are encouraged to do as they see fit.

Here - 'constructive' criticism is most welcome.

I support Thomas's comment.

From: Al copland
Topic: 3266 Message: 3271

Hi Eric,

So you are happy to advertise on an existing forum for your new one. Not quite in the true spirit of Amateur radio IMHO.
Fortunately we are NOT AMSAT-NA and don't have an 'acceptable use' policy. We leave that sort of thing to the conscience of our members. After all, there is such a thing, and we should not forget it.

Lastly, thank you Thomas, for your support for the EU-AMSAT forum. It is appreciated.

Subject: Re: [eu-amsat] New satellite forum online.

Hello Thomas,

I started this forum mainly for Belgian sat users. As satellite manager
i wanted to create a place where you can find info and discuss about
satellite stuff.

In less then 24 hours there are 35 registered users, so i guess there
is intrest for this.

73,

Eric.

Hello Eric

What is the intention of your new forum ? We are a very good group

here and can discuss about all satellite themes and often more.

3273. ao-51 crash?

Yahoo group: eu-amsat
Date: 2010-03-28 22:47:48 UTC
From: Luc Leblanc
Topic: 3273 Message: 3273

At 2234UTC while AO-51 was in command mode (WOD data tranfer) the satellite crash on both downlink frequencies. It happen i think a lot of
time when the satellite is in this command mode and/or WOD downlink. Could be this WOD data collection can be done elsewhere on earth as
it will be a good backup if the usual NA command station became unavailable eg: silent key in the worse scenario?

It will not solved the crashing issues but it will give NA users more up time but but but the power of controlling often overcome the well
being of the crowds.

Hello Al and group

I get a reaction in the AMSAT-DL Forum from Martin, a student at
the TU Dresden. I will only repeat the technical aspect here.

He writes, the power consumption of 650mA at 3.6V standby is too
high for a single Cubesat. The power from solar cells would be
too bare or not enough. There are also other power consuming
modules in the satellite. But intermittent operation would be
possible.

From: John Hackett
Topic: 3244 Message: 3276

Hello Thomas,
Interesting post and well done! that you post to the Amsat-DL forum.

By the way, Al has always advocated that a single cubesat is inadequate, regarding power consumption - WITH THE CURRENT TECHNOLOGY.

I think Delphi-3 brought home this fact quite clearly.

Hi Thomas,

He doesn't say which type of solar panel he is talking about, the efficiencies of different types vary dramatically.

He's certainly correct that low efficiency panels wouldn't supply enough power, you'd have to use one of the higher efficiency types which can give twice the power.

Fold-out panels may be another way of increasing power further.

How much is enough?

A Cubesat with modern high efficiency cells can supply an average power
of over 2 watts in sunlight. The problem is that the battery guzzles
quite a bit of that, along with other systems, to provide 'housekeeping'
and power when in eclipse, so 650ma may indeed seem a bit greedy to
supply what is really the primary payload.. the transponder.

'Matrushka' type panels I've already described earlier. These are use
extensively in commercial birds, to very good effect. Ditto pop-out ones
wrapped around a smaller panel-clad core.

Power consumption is not such an issue for CUBESATS if you delete
other power hungry items, especially the (inefficient) batteries and
the IHU.

Let's face it, batteries effectively kill many otherwise useful
satellite missions. Check your history.. Google will befriend you.

AO7 'got lucky' but is very much the exception rather than the rule.

Do you really *need* an IHU on a simple sat? I'd respectfully suggest
not. A command RX and some simple command logic would be perfectly
adequate. Worked for AO7 and would be far easier to implement now.

Ditto the battery. They are nothing but trouble... in the long term.

If you fly a simplesat... command and control + transponder , aerials and solar panels, the volume (and mass) saved by deleting the extras (including battery and IHU) can be put to excellent use for extra power generation. The price you pay in one sense is that it's a daylight-only bird, which IMO actually adds to the fun element. The upside is that battery failure can't kill such a bird, as it does with very many others. No battery... simples! In a suitable orbit it could last a very long time indeed. The real problem is not actually power consumption, it's finding a suitable launch into a decently high orbit, even for a puny 1U CUBESAT bird. Most CUBESATS end up in very low and short-lived orbits, thankfully for me, because IMO they are not really amateur radio birds at all.

I've said for a long time that the CUBESAT format is really too small for a linear bird. Go to a *8*8*8 inch CUBE and things suddenly look VERY different. Resist the urge to add mass, and an 8*8*8 lightsat in LEO could do great things for us all.. with or without batteries. (The death of batteries is inevitable... wet chemistry). I'd delete them. Simple is often best IMHO.

A few years of 24*7 operation (with batteries) or decades of operation (without). That's one choice we face. For me at least, it's a no brainer. The 'designers' wont like it of course because simplicity lacks 'challenge' but I'm pretty sure the users would like such a bird.

Molniyas? They are consigned to history. The future is small and circular. Unless of course a miracle takes place. I think we'd best get used to reality.

3284. Operating AO-51 From down under

Yahoo group: eu-amsat
Date: 2010-04-01 06:48:21 UTC
From: murrayhely
Topic: 3284 Message: 3284

Hi All

Operate S band is a nightmare with my insensitive
Galaxy Converter and my Uniden UBC72 scanner

I have to track the satellite manually . I have brand new
Keps and Timing from the last pip on National Radio
(same as ABC in Oz). As I am not a repeater or FM
person I do not have tuneable UHF FM gear.

The scanner is set to 6.25 kc channel spacing at 450 MHz

Start of pass

Ch1 450.250 MHz Start AOS
Ch2 450.243 MHz
Ch3 450.237 MHz
Ch4 450.231 MHz
Ch5 450.225 MHz
Ch6 450.218 MHz
Ch7 450.212 MHz
Ch8 450.206 MHz
Ch9 450.200 MHz Mid Point
Ch10 450.193 MHz
Ch11 450.187 MHz
Ch12 450.181 MHz
Ch13 450.175 MHz
Ch14 450.168 MHz
Ch15 450.162 MHz
Ch16 450.156 MHz
Ch17 450.150 MHz End LOS

I have worked VK5ALX and ZL2BX so far. My
operating time has been very limited because my
wife is sleeping for night shift and the rotators
on the roof are to noisy to operate when see is
asleep.

All the Best Murray ZL3MH

Have you considered how such a capacitor functions? At the moment, the technology is nowhere near good enough, and would we really want it?

If you look carefully Nader, you will realise that a 'super-capacitor' is made from thin-film 'wet' technology also. It is simply a 'wet' electrolytic, works just like like a conventional one, but has a far thinner dielectric layer and a far greater surface area. What do you think will happen when such a thin film device takes repeated hits from energetic particles? I suspect it will fail. Consider also that electrolyte loss will lead to loss of capacitance over time.. like any electrolytic does, and just like batteries do. Supercapacitors are not small, or lightweight either.

If you wish to build a small craft that will operate reliably for tens of years, yet provide adequate electrical power from a small CUBE, it's makes sense to simply omit the high risk components that ordinarily kill satellite missions.. wherever possible. You then gain useful volume (and mass) back that can provide greater solar power, when in sunlight. With no CPU to be killed by radiation and no batteries to fail, you would already be in a far stronger position to create a long-lived mission. A CPU is not at all necessary on such a mission, and although it would displease some, dispensing with a battery represents a strong gain for longevity also. One factor that would need to be addressed for such a mission is the degradation of the solar arrays by radiation, but modern (and very low mass) methods such as nitriding can help here.

This idea would best serve long lived missions in reasonably high LEO, such as the Russians get to with their near-polar launches to around 1000KMs from Plesetsk. You could have a long lived linear transponder mission, and I mean *long*, perhaps 30+ years...for very little outlay (in relative terms), so long as you can stay with daylight only operation.

No-one mentioned having a power guzzling CPU, we're talking about a Communications Satellite, you don't need masses of CPU power for that.

Do you see now why I'm convinced that 1U CubeSat linear transponders are perfectly feasible. BTW with the right solar cells you can get about 2.5 watts and there is room for a 3.6v battery. The trick would be to handle the battery failure so the CubeSat kept going when it failed. That way you'd get the best of both worlds, continuous availability for maybe as long as 5 years and after that only operating when illuminated.

Everyone agrees we'd like higher orbits and I'd contend that 1U CubeSats stand a far better chance of getting a cheap launch to a 1400 km orbit than a far larger satellite would. Sure the signal would be weaker but that's an acceptable trade-off.

Anyway I'm hopeful that in a few years time amateurs will be building 3U CubeSats with propulsion systems to get us up to elliptical orbits of 700 * 1500 km, or who knows maybe even 700 * 8000 km. The additional solar panel area on a 3U would give the capability of running far higher downlink powers than 1U CubeSats can.

Hello All

The initial idea was to add a linear transponder to an university experiment like the Uni Delft does with Delfi3C. This is not easy as we can see. DO-64 is QRT.

At the moment the only HAM-CubeSat with a linear transponder in relative near
future will be FunCube. If we want to have such CubeSats in the orbit then we have to f(i/ou)nd an AMSAT-organisation who is willing to start such a project.
This needs manpower, optimism, much time and money. Otherwise we can discuss our dreams here until we have white hair. ;-)

You don't need a CPU in a simple transponder satellite... period. But of course the 'designers' will always want to include one.

> Do you see now why I'm convinced that 1U CubeSat linear transponders are perfectly feasible. BTW with the right solar cells you can get about 2.5 watts and there is room for a 3.6v battery. The trick would be to handle the battery failure so the CubeSat kept going when it failed. That way you'd get the best of both worlds, continuous availability for maybe as long as 5 years and after that only operating when illuminated.

I disagree.

Actually you wouldn't get the best of both worlds. In reality, it's a bodge, simply because the battery you are suggesting, plus it's control system, occupies mass and volume that could far better serve power generation (and longevity) to compensate for the high-ish orbit. The battery only adds unreliability, while reducing the possible power generated.

Re CPUs. Some modern CPU are very energy-efficient, but since a simplesat doesn't actually *need* a CPU, why bother.

I imagine that you were talking about something else... perhaps FUNSAT? I most definitely wasn't mentioning FUNSAT... simply a better way to ensure a far longer life and more power from a puny little linear-transponder carrying CUBE.

Well Trevor, I can't agree with you that 1U CUBESATs with batteries and a 1W PEP linear transponder are feasible. Here's why. Firstly, quite a lot of the available power in sunlight(about 2.6 watts with efficient panels) is required to drive the battery to provide power in eclipse thereby leaving very little power to run the transponder.
Remember also that a 1W PEP linear transponder (in being linear!) consumes quite a bit of power... and the idea of flying battery and transponder suddenly looks rather ugly. Quite a bit of that power is simply converted to heat in the PA in order to keep things linear.
There's no room for HELAPS (yet) in a Cubesat :-)

The numbers don't add up, IMO for flying a 1W PEP linear transponder and battery in a 1U CUBE. Why don't you do some calculations and prove it to yourself?

The most obvious course to provide a long lived and useful linear CUBESAT is to delete the battery, not fly a CPU, and use the 'surplus' volume and mass freed up, to carry more solar generators. By doing this, you can run more downlink power and ensure / expect a long satellite life expectancy.

Agreed higher orbits are desirable, but the Russians already go there anyway, so why waste valuable mass and volume on unnecessary propulsion systems?

>
> Everyone agrees we'd like higher orbits and I'd contend
that 1U CubeSats stand a far better chance of getting a cheap launch to a
1400 km orbit than a far larger satellite would. Sure the signal would

Hi Group.

Thomas said...

> If we want to have such CubeSats in the orbit then

I don't. But AMSAT-UK clearly do.

> we have to f(i/ou)nd an AMSAT-organisation who is willing to start such
> a project.
> This needs manpower, optimism, much time and money. Otherwise we can discuss
> our dreams here until we have white hair. ;-)

Very true Thomas, but the current situation is that launches *do* cost market rates so we are effectively constrained by that to build small projects. That said, the CUBESAT format is really too small to serve us well. We all know this, but we still try to make a silk purse out of a sow's ear. AMSAT-UK *is* planning one, and I wish them luck. I suspect they will need it.

When I joined AMSAT-UK as A-UK #3286, I had lots of hair. In fact enough to reach down my back, in a 'pony-tail'. These days, I'm sad to say, I have almost none at all, and what little I do have is a shade of grey. In that time, we have had three Molniyas launched including AO-10 and AO-13. This of course omits P3-A which was lost in a launch accident. Then there was Oscar40. Ah well! I'm not sure such projects are financially viable any longer, so people look around and see.....ummm!.... CUBESATs.

The triple CUBESAT format is really not an ideal one for a linear transponder bird either, but a 150 or 230mm square CUBE is a completely different proposition, because of the considerably improved surface area = power available, so long as the mass can be driven as low as possible. It's very easy to do the arithmetic to see why.

Should we not then consider a 'large Cubesat' in LEO format? A flying 'biscuit tin' like AO51, is a lot more use to us than a flying 'Rubik cube'. This format has worked before for AMSAT with the Microsats, and works for AO51, but by employing the KISS technique to drive the mass down, rather than using the machined trays that the Microsats and AO51 did, the cost to 1000 KMs or higher would become much more attractive.

I do think all the avenues should be explored. There is no particular reason to stick with the standard CUBESAT model when alternatives clearly do exist. It's not really in our best interest to persist in hammering away at something thats only barely fesible.

S band DATV

Better to be prepared than sorry!

Did anyone have an idea how to feed a DATV signal coming from the actual S band former TV converter eg: Transystem AIDC 3731A? They where
made for analog TV i think and i don't know if they will be usable for DATV? As the output is made for 75 Ohms regular cable TV set
connector i think any signal can be received on a standard TV set but with the modified IF output in the ham band or in the 123MHZ range it
fall into the regular TV set bandpass on 54 to 890 MHz. As per the specs it seems the AIDC 3731A is "digital ready" But is this digital is
in the same protocole than the already existing commercial digital protocole? On a French site they refer to a signal bandwidth of 48KHZ
that is too wide for any amateur radio standard rig but OK for a TV receiver but on other site they speak of 6MHZ!. Some search refer to
the MPEG2 protocole it is supported on various FTA receiver but QPSK in various flavor DVB-B DVB-C DVB-S is the mode reported on many site
in Europe but they confirm the QPSK DVB-S can be received with standard commercial digital receiver but not with the GMSK protocole (see
below for the links and info's)

TranSystem Inc., a world wide leader in MMDS/MDS technology, offers a complete line of PCS, WCS and radar filtering downconverters. Our
designs have been copeid by many, but the original out performs the rest. The digital ready AIDC easily integrates with parabolic antennas
or any of our esthetically correct antennas.

Hi Thomas,

I was thinking of purely an Amateur Radio 1U CubeSat. An add-on linear transponder to an existing experimental CubeSat would be difficult in that size, however, here's a thought.

One thing experimental CubeSats would like to have is a high speed downlink. They are currently restricted to 1200 or 9600 bps.

What would be good would be a Software Defined linear transponder which could be configured initially as a high speed (around 128 kbs) downlink with a bandwidth of 30 kHz then after 6 months when the experimental mission is over it could act as a 30 kHz B/W linear transponder.

Drawbacks are power consumption, Software Defined transponders currently have a processing penalty of about 300 mw. Also although these days it's routine to transmit a raw data rate of 12400 bps in a 3 kHz bandwidth on HF SSB, amateurs have not yet expanded that scheme to operate over a 30 kHz bandwidth. However, I note that Eric Johnson has suggested a scheme for HF which gives 120 kbps after error correction in a 24 kHz bandwidth.

Nader,
I believe you are an experienced WISP user. I have a question for you.

In the setup for HO-68 we have the broadcast callsign set to BJ1SA-11, the BBS callsign to BJ1SA-12 ...

What should I set the NUP - (New Upload Callsign) - to for HO-68 ??.

Even though this post is directed primarily at ST2NH, anyone else answering it will *NOT*be flogged at dawn.

I hope an enjoyable Easter was had by all - (for those that choose to believe that kind of thing) - and excessive amounts of 'choccy' Easter eggs were consumed.

If you've now got an upset stomach ... serves you right !!!.

FOR INFORMATION ONLY.

Having just worked HO-68 on CW with simple (old fashioned) equipment, using the homebrew spice box keyer and manual doppler correction ... (yes, I also have automatic doppler correction but it's boring!. It was golden opportunity to try out some home made gear again) ... it was a pleasure to 'communicate', using what is known as "The Noble Art" again.

<http://www.observations.biz/Observations_from_Norway/observations_14_06_2008.htm>

I'd like to say what a wonderful satellite HO-68 is. FM for the newcomer, CW for the semi-senile old dodderers like me and 'digital' for those that are that way inclined.

I was using low power and on CW the standard of operating was a far cry above the FM 'zoo' found on AO-51. Nice to see there are still some CW operators out there.

Well done! Amsat China with HO-68 ... just what was needed to rejuvenate amateur satellite radio.

Headline Details: A cubesat project designed for self training and validation of satellite communication on VHF and UHF. Various telemetry data will be available for amateur download using AFSK in addition to a CW beacon. Planned for a early 2010 launch into a sun synchronous near polar orbit. ** Co-ordinated up and down on 145.98 and downlink 437.305MHz.** For more information see: http://www.dti.supsi.ch or http://www.spacelab.dti.supsi.ch
Applications Date: 31/03/2008

It says 'Download' plus 'beacon' but I don't see 'transponder' anywhere. Perhaps I have missed something?

It also says...>Various telemetry data will be available for amateur download using AFSK in addition to a CW beacon.

The website listed says...
>Communication Downlink: IARU coordinated beacon frequency is 437.305MHz
Power: 400mW
Callsign: HB9DE.
TIsat-1 periodically identifies itself by its codename TISAT radiated as Morse code (CW) at 19WPM, along with basic telemetry.

Transponder? Where?

Telemetry data plus a beacon. No transponder I think.
Looks like another 'download only' non-amateur bird to me.

73 Al.
Hoping I'm wrong:-)

The forthcoming Swiss satellite appears to me to be yet another non-transponder encroachment into the amateur bands ... in the guise of 'education' ... (my opinion).

HO-68 is an *AMATEUR* satellite because it caters for amateurs with varying interests and has not one but TWO !! (switchable) transponders as well as the beacon.

It would be interesting to know just exactly how many 'amateurs' bother with - or are interested in these university 'me too' satellites.

Also ... exactly how many of the students eventally become space engineers once they've got their electronics degrees.

I think the powers that be 'know' the amateur bands, as a resource, are being given away ... but prefer not to admit it.

OFCOM ?? ... I believe OFFCON !! would be a better description.

The radio communications system is based on the Alinco DJC-6 dual band hand held transceiver and will run 400mW output on a downlink on 437,305 MHz with an uplink of 145.980 MHz.

if it's only for telemetry it run only downlink.

From: John Hackett
Topic: 3299 Message: 3306

That was my impression too Thomas, re: the forthcoming Swiss satellite, that the uplink was for the command station only - and if that *IS* the case - I wouldn't call it an 'amateur' satellite.

It's a UNIVERSITY satellite using the amateur bands that sneaks in the back door - and it's debatable whether or not in fact it's another *INTRUDER*.

The sheer *AMOUNT* of university satellites with downlink only telemetry IMHO doesn't justify them using 'exclusive' amateur uplink frequencies for their experiments.

Like GM1SXX stated - I hope I'm wrong and that the transponder will be open to all licensed Hams ... but I suspect it won't.

I refer once again to Commander John Brannegan's (GM4IHJ) 1998 warning that this would !! happen ... in the guise of 'education'.

I think the 2m uplink is reserved for the ground station in Ticino.

I have no information yet about a transponder use for HAMs.

I understand your objection. But to put all university-CubeSats in one pot is not a solution. If such a CubeSat sends his data in an unusual mode like GMSK and with an unusual protocol like Mobitex instead with AX.25, this satellite would be an intruder. This intruder could be "converted" in an educational HAM-sat, if the students would make a solution to receive the modulation with a modem or more likely with a soundcard-software. The transmitted data format must also be opened.

But THIS is the problem. If no communication exists between HAMs and students, this will result in conflicts.

> The sheer *AMOUNT* of university satellites with downlink only

I understand also this objection. But if they get a licence ? TIsat-1 got the call HB9DE. HB9DE was the former call of Terenzio Tallone. He was an young engineer and got his licence in 1938.

3308. RE: [eu-amsat] Transponder or not ...

Yahoo group: eu-amsat
Date: 2010-04-11 13:07:44 UTC
From: John Hackett
Topic: 3299 Message: 3308

Your points noted Thomas,

John Brannegan's main concern was that the universities were copycatting eachother and *NOT* providing anything interesting or useful to most satellite amateur radio operators ... that is to say ... freeloading - and providing something for a mere handful of operators.

I agree with you that better 'communication' is called for.

By the way, I'm *NOT* against university projects but I *DO* wish they'd provide something interesting to the
average amateur satellite enthusiast like certain individuals keep telling us they do ... (when they don't).

What I do object to is a satellite organisation promoting FM amateur satellites and consequently being responsible for the impending chaos on satellites like AO-51 over Europe.

A linear transponder with room for 10 consequative QSO's - as opposed to the - 'mine's bigger than yours' - single user mentality of FM would be far more sensible.

The problems are of course financing a non-cubesat satellite and then eventual launch costs.

GM1SXX mentioned to me that the *FUN* had gone out of amateur satellite and I was in 100% agreement and was on
the verge of throwing in the towel completely ... but luckily, HO-68 came along and saved the day. Now IT'S *fun* to
work satellites again.

There is of course a satellite called FUNsat planned ... if it ever gets into orbit ... but I'm not holding my breath.

NB:

THE ABOVE IS MY PERSONAL OPINION.

Have a nice Sunday you too Thomas.

3309. TNC interface for icom 910H

Yahoo group: eu-amsat
Date: 2010-04-12 09:59:14 UTC
From: Francisco Jiménez-Martín Sánchez
Topic: 3309 Message: 3309

Hello all,

Recently I□ve bought an Icom 910H and I would like to use with a TNC in satellite mode and in normal mode, using the main band, but as you will know this transceiver has two mini din connectors, one used for the main band and the other is used for the suband, I would not like to lose the main band, that it is used, for instance, when you work the ISS in simplex, but If I make a simple interface taking the tx from the main band and the rx from the suband I will lose working with the main band in simplex.

Any idea to recommend me to solve this issue?

Thanks in advance,

73 de EA1JM, Fran

Hello Francisco

If you make your own interface, build one for both cables so you can plug
in both cables into your 910H. Make separate switches for the audio lines
and PTT lines. On the front panel you can arrange the switches in logical
order for e.g. duplex and simplex or whatever.

Hope this helps.

From: John Hackett
Topic: 3311 Message: 3311

To whom it may concern,
Despite a clearly stated schedule we still have a conflict between PACKET and FM voice on HO-68.

The schedule from 17:20 until 18:05 today, the 13th of April clearly earmarked HO-68 for PACKET operation ... with FM voice being set for 19:00 until 19:45.

Despite this, there was still a GENTLEMAN (?)
from one of the Scandinavian countries beginning with the letter F (!) -
calling on FM at 17:33 - and making a mess of the
PACKET communications.

Sir, by actually reading !!!! the published schedule on the Amsat-bb ... or here ...

<http://www.dk3wn.info/p/?page_id=10390>

You could make life easier for yourself and other Hams using the satellite.

I would respectfully suggest that the reason nobody answered you on FM voice was because that particular pass was earmarked FM PACKET.

If you are one of the few previously *not* aware of the schedule, please accept this reminder in the spirit it's meant ... please read the schedule and adhere to it.

It's very purpose is to avoid conflict between PACKET and FM.

Hello John & group,

I made yesterday one CQ (if I remember correct) on yesterdays HO-68
pass when the sat was commissioned for packet. I _do_ read commissioning schedules, I was just "one pass ahead" of that in my mind. I heard mostly packet bursts and then I doublechecked the schedule and noticed myself my mistake and kept my mouth shut for the rest of the pass.

My sincere apologies for the possible harm I caused for packet users on HO-68 on that pass.

Hi Fran,

You should check in www.camsat.cn for the operation schedule.
It is possible the transponder is switched off when you were trying from your location.
Times used in schedule are all UTC.

3319. RE: [eu-amsat] Settings to work HO-68 in FM

Yahoo group: eu-amsat
Date: 2010-04-15 08:38:39 UTC
From: John Hackett
Topic: 3316 Message: 3319

Francisco,
Many people have been experiencing the same problem.

It's a viscious circle (a problem that increases with repeated use) where people increase power thinking that is the only way to get into HO-68 ... which of course just adds to the problem and makes it worse ... and worse.

It's due to people 'flooding' the front end ... the receiver can't cope. If you listen, you will hear several stations in different parts of the range circle calling on top of eachother - but not !!! necessarily hearing the other stations calling. This completely swamps the the receiver's front end and the only people that can get into the satellite are those using excessive power - or - those lucky enough to slip through in a break of the mass hysteria (zoo) ... tailending another call.

There is a couple of seconds 'delay' (called a 'tail) after the relay switches so a tip is to wait for the other station to say 'oner' - then say to yourself ... "one" "two" ... before pressing your PTT ... and *DON'T* use VOX because the first syllable of your transmission will be lost.

FM is *NOT* the smartest choice for an amateur satellite transponder due to it's 'capture' effect (works well if there only a single command station, like the commercial birds).

Luckily, HO-68 also has a LINEAR mode where the operating is more civilised and there's room for everybody.

Hope that helps.

3320. FM satellites.

Yahoo group: eu-amsat
Date: 2010-04-15 08:53:30 UTC
From: John Hackett
Topic: 2564 Message: 3320

Group,
To better understand the problem of operating FM on a satellite imagine three packet stations, A, B and C ... with one of them are operating as a digipeater communications are upheld.

Lets call the satellite station B ... which can hear both A and C ... *BUT* A cannot hear C and C cannot hear A so they both call at the same time. Now, B, because of it's capture effect only replies to the strongest station, lets say A.

At the same time, C thinks ... hrmm, not getting through here, lets increase power! ... which compounds the problem for the next station D ... and so on ... E, F, G etc ... as the satellite moves along it's orbit.

With a LINEAR mode you can actually 'HEAR* the changes as the satellite progresses along it's orbit - but you can't !!! on FM ... (unless you happen to be listening to the CW beacon on a second receiver).

That's !!! why FM is *NOT* a sensible mode for amateur radio satellites.

Hi Jhon & All
thanks for nice tips and hints about FM sat.

Just I want to add more info in the case of broadcast protocol on PACSAT ie FM mode.!

In pacsat protocal the satellite can listen to many stations in the same time and arrange them in a queue eg HO-68 can list 10 stations in a queue .
in same time any broadcasting files could be downloaded
by any station too even if it was not in the queue. the space craft deal with requests one after other.

Notice coz the sat is dullduplex no collision well happen between ground station requests and the download data from the space craft.

IMHO pacsat broadcasting protocol is most efficient mode on FM sat.

73's de Nader

Hello Nader,
You said ...

>IMHO pacsat broadcasting protocol is most efficient mode on FM sat.

I absolutely agree with you Nader ... for the very reason you mentioned.

There are more newcomers coming into the hobby and it's relatively easy to operate HO-68 with the AGW software and UISS (both FREE) or WISP, though that's a little more complicated to set up.

All the programs do have extensive HELP files though.

I''m aware that you've mentioned these programs on your blog Nader. Perhaps you'd like to write a little - "How to operate the packet BBS on HO-68" - for the Observations website ?? ... (Observations from Sudan?).

I'm sure it would encourage a few newcomers to try the mode.

If you want to do it Nader, just send any copy to me or Al, GM1SXX ... <allan_gm1sxx@...> and we'll ensure it's published on the OBSERVATIONS website at <http://www.observations.biz>

Hi group.

re FM satellites, Nader says...

>In pacsat protocal the satellite can listen to many stations in the same time and arrange them in a queue eg HO-68 can list 10 stations in a queue .

I find this impossible to believe. I'd suggest the packets are surely received, from a sequential stream... and not concurrently.

Perhaps someone far more clever than myself can explain how this is possible on an FM bird? I find it incredible that any FM receive system could resolve multiple packet QSO's simultaneously (at the same time), as Nader suggests.

My personal understanding of FM receivers (including satellite) is that capture effect always prevails, so the strongest signal will always capture the satellite's receiver, to the detriment of any other weaker signal. This is certainly true with terrestrial FM. So to my question... are my training books completely wrong about FM, (because I teach this stuff from RCF approved books, to students) or perhaps FM satellites can do something clever that FM on the ground can not to 'bend the laws of physics'? NOW I'm confused.

Frequency Modulation 'capture effect' has always been the basis of my objection to the use of FM on amateur satellites, simply because FM cannot suport concurrent OSO's. In short,I consider it a very inefficient use of very valuable bandwidth.

Yours, (very confused!)

73 Al.

Hi group.

To what I have already written on FM capture effect, I would add that I do realise that some previous satellites had multiple FM receive channels on several different uplink frequencies to cope with multiple uplinks, but I don't think and of the current birds are of this type. Multiple receive channels are rather different from a single shared channel. With multiple channels you only have contention for EACH channel to consider.
It's perhaps not ideal, but for sure beats a single FM uplink, and adds complexity at the satellite end of the link.

Topic: 3325 Message: 3325

Hello Al,
Pacsats - including HO-68 use the AX-25 standard 1200 baud packet protocol.

They build a BB from sequential packets and they broadcast a 'block' of packets as a stream of data. Programs like WISP and/or UISS can 'build' the database from these sequential packets ... filling in 'holes'' - (parts of the data *missed* in the previous transmission).

73 John.

Hi folks,

John explains all. It's just AX25 packet radio, collisions, contention and all.

Having the uplink and downlink on different bands helps I'm sure.

Al.

Hello Al,

Correct, but it has nothing to do with the data rate. The PACSAT-protocol is an additive layer on AX.25.

>

Also correct, but I would say the mailbox sends requested parts of data files.

>
> 73 John.
>

UO-14, AO-16 and LO-19 were the first satellites with a mailbox and PACSAT-protocol. UO-14 had trx'ed with 9600 bps FSK, AO-16 and LO-19 with 1200 bps "Fuji mode". Fuji-mode was "created" by JARL HAMs and means uplink in ManchesterFSK FM and downlink in BPSK SSB.

James, G3RUH, developed the modems for TNC's. I have a Heathkit HK-232 (PK-232) and this modems attached in my shack. Its good old self made hardware. :-)

HI gentilmen

The pacsat protocal works fully automatic .If the GSC software was been prepared well the operators suppose to - DO NOTHING -
apart from enjoy their hot tea and watching their monitors.

It is just a one request and you should be in the queue.Im not taking
about sending dozen of request to space craft as I've noticed recently
some op did.

No jaming or zoo its polite request , It is like (Ok I hear you
Nader wait for your turn . but while you are waiting listen to
other station answers you may well get what you want).

Many Op keep sending Dir fill request and for sure this follow the physical rule of FM capture effect. Yes I 'll write more a bout Pacsat
Mode and thanks John for the apportunity to post it on Observation.

Nader,
You said ... (regarding PACSAT operating) ...

>No jaming or zoo its polite request ...

Exactly !!!.

The same is true of CW and SSB - and in those cases much is due to the fact that stations can actually *hear* eachother - or should I say - stations actually *LISTEN* before they speak (!).

>Yes I'll write more about Pacsat Mode and thanks
> John for the apportunity to post it on Observation.

OBSERVATIONS is primarily a website dedicated to and for amateur satellite operators run by GM1SXX and myself.

Al does all the work while I take all the credit for it.

It's meant to be an archive of useful information for the newcomer and experienced operator alike.

We also founded this forum, where, the intention is, people may express their opinions on subjects of interest to satellite operators without fear of being criticised and made to feel stupid.

We were all !!! newcomers once upon a time.

Diversity is the spice of life .....(La2qaa).

Gentlemen,

please consider that usually the data volume of the uplink
is by *far* smaller than the downlink data volume. I do not
mean the data rate but the data volume which is proportional
to channel occupation time, at least for the uplink.

You just trigger a download and the satellite sends it in the
downlink data stream. When you missed block, you request those
missing blocks, which are then inserted into the downlink
data stream again. Both "trigger" and "request" packets are
very short, hence the probability of collisions is relatively
low, although not zero.

The situation is worse if somebody is uploading a large file,
then the uplink data volume is much higher and the occupied
uplink time is much longer and the probability of collisions
rises. But over an orbit or so the real data upload time is not
too long, of course depending on file sizes.

But you certainly can't compare the uplink situation of a PACSAT
protocol satellite even with only on uplink channel with a standard
FM satellite.

KP4AO 54/55 SSB in South East Romania with 15 el YAGI on an astronomy tripod pointed on window to the moon, GaAs preamplifier, about 3m LMR cable and Yupiteru MVT 7100 scanner. Impossible to make a qso with max 30w tx power - HI

3335. Arecibo recordings

Yahoo group: eu-amsat
Date: 2010-04-18 11:43:08 UTC
From: Luc Leblanc
Topic: 3335 Message: 3335

Here is 2 recordings of april 17 Arecibo EME transmission received on a linear 24 elements yagi with an Icom preamp on an FT-847 60' of LMR-
400.

http://www.yourfilelink.com/get.php?fid=541211
http://www.yourfilelink.com/get.php?fid=541210
http://www.yourfilelink.com/get.php?fid=541209

My first observation is while some seems to report great reception with moderate set up? i cannot say my first EME reception is Q5... When
you listen the audio file put your volume up as KP4AO is way down in the noise but after a couple of try you will be able to detect some
words from them. The CW recording is much better with the maximum of filtering.

Conclusion:1- An LEO class satellite station does not make an EME station at all.
2- Accurately reporting a reception by ears is not an exact science... recording tells the truth without any doubts
3- My third file is giving some explanation about why my JT65B program give's me 4 EME call sign: F5BUU KU7Z K3AX IQ2CJ

I will try this mode if they used it but as i does not want to be controversial i think the 4 stations that i got on my JT65B screen where
probably never transmitting at the time of reception!!!

Just read the third file above and you will be able to understand more my point 2!

Anyway it was my first EME SWL reception "i hope" as some just tells me it is possible that tropo scater reflection in the caribbean and
ducting made some getting the Arecibo signal this way as their EIRP made it quite possible explaining the rapid QSB reported by some
station. Here as soon as i move the antenna off by 10 deg Arecibo disappear.

Just to pointed out i was listening the HAARP EME test 2 years ago and i was able to copy their HF ionospheric signal and their moon
reflected signal much much weaker but some on the world where only able to get the moon reflected signal as they where out of range form
the standard HF propagation path. Just to warned those in the tropo scatter/RF ducting path from Arecibo to checked if moving their antenna
off the moon make the signal disappear.

P.S. If someone is aware of an audio software able to filtered out the noise from a recording just pointed me toward the source.

Good point. On 17 i hear nothing. Next morning i see that they use only 25w in the dish having problem with PA. On 18 evening the signal was low but clear i think they push with 350w. So, your equipment is great. Hi
For signal recording and after prelucration a very easy and good software is Audacity http://audacity.sourceforge.net/ (exists also for windows). You can make even spectral analysis.

Luciano,
A very interesting and intelligent question ...

Anybody ?? ...

73 John. <la2qaa@...>

Subject: [eu-amsat] Vulcanic Ashes

Because the ash particles are statically loaded, they may interfere with the radio traffic.

Has anyone experienced satellite comunications inteference so far?

Just out of curiosity...

Very good question.I'm in south east Romania and all is ok. I make observation and photos Mars-Gemini with my 114mm Newtonian telescope at the same magnitude. So optic nothing change. The same good signal for LEO. Even i hear on 17 evening KP4AO on west.They say that is danger to fly but where is the cloud? For the moment, optic and radio all is the same except the news.

The plume is affecting the UK and some parts of Europe. This morning, the UK airports all appear to be closed again. I live and work close to Glasgow Airport and it is dead again today. We are enjoying hearing the birds rather than screaming jet engines. It has been very quiet here for days now.

The European Space Agency (ESA) have been monitoring the ash plume from space and have posted an animated movie at ..
http://www.esa.int/esaCP/SEMKDU9MT7G_index_0.html

Although like the remainder of the UK, the West of Scotland where I live is a no-fly zone, the sky *looks* relatively clear, even at night with the telescope, but we are seeing light dust deposits on cars and other surfaces, so the fine ash is coming down, but is very light here. I'm told the problem is worse in the North East of Scotland and elsewhere in the UK. The dust cloud appears to have crossed from Iceland the North of Scotland then tracked down the East coast of the UK to spread out over the South of England. The authorities are reluctant to allow aircraft to fly because if the dust is ingested into a turbine engine core, it gets re-melted into small droplets of hot lava inside the 'hot' section of the engine. The particles can also cause damage to aircraft structures and cause erosion of turbine blades. So although we can't see much, the dust is out there. It seems to be having no effect on radio communications.

Hello Nader,
I've also operated from the middle of the Sahara Desert in a sandstorm
but admittedly, on HF - but with no detremental effects propagation-wise.

The only 'precaution'' taken was to line up the troops under the aerial and 'irrigate'
the sand as a pseudo groundplain (!) ... 'watering' the sand in tact with my keying.

Did anyone ever tested their downconverter who is basically a receiver to measure the amouint of desense the WI-FI , spread spectrum and
frequency hopper device and so on produce on 2.4Ghz?

Desense is very noticeable on VHF and UHF when a transmitter is transmitting near a receiver as per i can see on a PCR-1000 scope screen
there is always a 10db noise floor but i'm not sure if this level is not really much higher as the scope seems to not be fast enough to
display the real peak level of all the signal on 2.4Ghz.

If a fairly high amount of desense is always present this could explain why the downconverter is lacking sensitivity and why some normal
fades appears deeper than they really are. And what is worse is the WI-FI QRM is also right on the received 2.4Ghz amateur band.

Here i have to switch off my WI-FI router and my 2.4Ghz camera when i want to listen on 2.4Ghz and the camera is the worse as she give 30
over 9 very wide spread signal.

Opinions are welcome.

>
>
Hi Bob

I have the same DC but my IF is on 123mhz and i got no desense at all on 2M but that's the 2.4Ghz RF your "snapping, popping" who i think
is could be reducing the RF sensitivity of the DC. The AIDC was design to received MMDS TV where channels where isolated from each other
and they was no other QRM on the original band this downconverter was design for. How he's performing on a band full of QRM that i don't
know and it will be something to test to see if the DC keep his same sensitivity when is QRMed on 2.4Ghz.

Adding some sort of flitration is could be a way to reduce any 2.4Ghz desense if any and what the noise blanker does is to suppress the
pops and clicks but he cannot reduce the overall QRM level.

Our regular Ham receiver can be tweaked for the best reception possible but with a DC we are stuck with a static passband, no way to reduce
the RF level and so on.

I don't know how wide the AIDC 3731AA front end was but to be able to receive TV signals it should be quite wide and he should pass a lot
more than 15KC?

W1RJA EME event, Echoes of Apollo

Aside of the "Pickle dipole" did any one have an idea of their setup? (Amp power and # of beam element) A linear amp and the beam stacking
is giving the required ERP on the TX side and the 3db stacking gain seems to make the difference between reception just at the noise level
and something above the noise. This EME was a good overall satellite station test. 50 watts and one single beam was too borderline to have
a decent 2 way contact but without the real Arecibo ERP TX figures it is hard to say if a setup is below standard equal or above.

It's an old habit like stapling documents at the left instead of the right! but what about driving at the right instead of the left? In
both case the result is the same! sheets of paper are stuck and cars are running on the roads. Did they staple their documents at the right
in UK?

The answer we are all looking for is how much was the real ERP at the Arecibo moon experiment and the side illumination of the dish should
not introduce some losses as the lobe should be adjusted through the feed to track the moon but no one ever mention this?

Did they keep the feed in a general aiming position making the moon passing through the lobes? Or are they tracking the moon always with
the main lobe? We should not take these figures theoretical as cash. Effective radiated power is could be much more lower than figures
says.

Did they measure the real power at the feed? I remember to have read somewhere some feed loss figures.

My guess also is that many are probably receiving (in the range of) ground wave or a reflected tropo scatter or weather inversion ducting
instead of the moon reflection!

From: John Hackett
Topic: 3355 Message: 3355

Group,
More confirmation that HO-68 is a wonderful satellite.

The pass on Friday evening at 230420101815Z covered from Spain in the west to Pakistan in the east - and from northern Norway in the north to southern Sudan in the south.

That's *WELL* over 50 countries.

It was a bonus working 'BOTH' Domenico (I8CVS) 'AND' Igor (RW3XL) on the same pass.

Igor tells me he's been working cross satellite quite frequently lately ... between HO-69 and AO-7 as well as HO-68 and FO-29.

His cross satellite and my knife-edge propagation mode make operating amateur satellites really interesting.

Well done! Cansat.

73 John.

3357. HO-68 versus AO-51

Yahoo group: eu-amsat
Date: 2010-04-25 20:50:07 UTC
From: John Hackett
Topic: 3357 Message: 3357

HO-68 v AO-51 ??.

HO-68
versus AO-51 - and the university downlink only satellites - (aka the FM
menagerie).

In my honest opinion it's a 'no contest' scenario -
with HO-68 winning hands down.

The two main reasons for me making
this claim are ...

1) HO-68's superior orbit.

2) It's
multi-mode transponders.

On a typical European pass an HO-68
orbit has a footprint the covers from Spain in the west to India in the
east, Norway in the north to Sudan in the south ... and all points in
between.

Whereas AO-51 is FM only ... HO-68 has transponders for
CW, SSB as well as FM.

HO-68 is (IMHO) easier to operate due to
it needing less power to get into the transponders, albeit, to really
take advantage of that, a knowledge of CW is required, which *STILL*
shows it's great advantage as weak signal mode.

When all else
fails ... switch to CW.

Igor, RW3XL has been operating cross-satellite with HO-68 to VO-52 and HO-68 to
AO-7 ... keying the up down buttons for CW since his keyer is on the blink.

For those wanting to learn, the 200mW beacon sends *SLOW* morse and it's copyable on a
piece of wet string wrapped round a rusty six inch nail.

I've proved this over and over on HO-68
at the beginning of passes when the elevation is under 20 degrees and a
SSB just can't make it - switch to CW - Q5 copy - (Domenico, I8CVS
will endorse that).

I believe that HO-68 is becoming the
experienced 'operator's' satellite while AO-51 will remain the platform
for the potential newcomer ... where they can QRM eachother to their
heart's content ... more power Egon ... MORE POWER !!! ... (with due

apologies to the Hollywood film 'Frankenstein').

For me at least,
HO-68 has brought the fun back into amateur satellite operating,
particularly on CW ... akin to RS-10, the most popular satellite ever -
(judged by the amount of users) - after the veritable old AO-7.

While
everyone is entitled to his or her opinion, operating FM on a satellite
is about as much fun for me as watching paint dry and is, in my
opinion, the worst possible way to introduce a potential newcomer to
amateur satellites. My EU-Amsat co-founder, SV1BSX
(SK) first used
the word 'zoo' to describe the AO-51 standard of operating.

There
ought to be a sign on the microphone ... PLEASE DON'T FEED THE ANIMALS.

New Easy Sat!

Thank you very much OM John for the nice post.

Once upon a time an old man told me"My son you will never get a DXCC on LEO" !! Time change and Now there were more than 50 dxcc in one foot print of HO-68!! unfurtunitly the active satations are vere rare in Africa Asia and Midle east !! nowadays only 4 or 5 Entities active from Africa ST,ZS,TR and 5R !!

IMHO this is a good time to QST the easiness of HO-68 .I hope every station on Africa Asia and Midle east try to work the new 'easy sat' .

Hello Nader,
Thanks for the links, much appreciated. It seems even the Americans are starting to take EU-Amsat seriously.

All thanks to the excellent support (posts) from many members.

I followed your own BLOG to set up WISP with MixW - specifically for HO-68.
I remember Howard Long did this several years ago for UO-22. Other amateurs have also contributed and passed along the information.

That's what it's all about, helping eachother ... and your BLOGS do just that.

Thanks Nader. As the only active African station (so far) your contributions are very much appreciated.

Nader,
you're absolutely right. It *IS* time to encourage more stations in Africa, Asia and The Middle East to operate HO-68.

I noticed in the last linear period (last week) India as well as most countries in central and north Africa were in the footprint. As you correctly state, more than 50 countries!.

(Strange you should say that because I mentioned the very fact of DXCC on HO-68 to GM1SXX just 2 days ago).

Lets hope everybody *WILL* encourage potential newcomers from Africa, Asia and The Middle East.

Amsat-UK and Amsat-India please note.

Yes, hometown shut down. Everything is published on the "new" website.
The "new" website is www.quagliana.com and if you just want UPW then
jump to www.quagliana.com/upw for the webpage or for the program go to
www.quagliana.com/upw/upw107b.zip

But UPW only does 1200 baud Manchester, and was really intended for
single packet digipeating, not BBS access via WISP. Also, I think
you have to select a satellite in UPW, which sets one of the VIA fields
in the AX.25 packet, so I probably have to update it to include HO-68.

Do you know the digipeater name to digipeat VIA for HO-68 ?

Douglas KA2UPW.
.....

I've given Douglas the required information and asked him to update his UPW program. I'll post a note on the reflector when this is done.

Hello John again and group

HO-68 uses simple 1200 bps Packet Radio with Bell-tones 1200/2200 Hz and
not Manchester encoded FSK (MFSK). If you want to digipeat, the digipeater
must be activated. You can see it in the telemetry-line. "D:0" means off,
"D:1" means on.

Hello Thomas,
Thanks for your help.

Two things ... I'm not interested in 'DX' ... I've got plenty of DXXCC's for various modes. My comments were a reflection of something Nader said, aimed at potential newcomers.

However, somewhere where I 'COULD* use some help ...

I'm most definately *NOT* a packet expert though I did used to occasionally work the Pacsats with a PSK1 modem.

Again, building on one of Nader's comments and his excellent blog I thought packet on HO-68 without a soundcard might also be something for the newcomer ...

However !!! ... I failed to get WISP and MixW working together and my thoughts were ... if IO can't do it, it's unlikely a newcomer would manage it ... unless they were a computer expert.

There *ARE* instructions on the web of course but i havn't learned to speak Japanese yet.

What we need is step bu step instructions for *STUPID* people like me. The nearest I've found is G6LVB's instructions for wisp/MixW from 2002 for UO-11 ... but I can't even manage that !!! properly either.

OK !!! ... maybe it has something to do with my inherent laziness (!) which, incidentally, I have perfected to 'a fine art' ... but what we need is a 'talk-through' SET-UP FOR DUMMIES ... WISP with MixW.

(I've got WISP set up correctly for GO-68, I've got MixW set up correctly for Packet, I've got VSPE on the computer ... I just can''t get the COM ports to work together.

When somebody says ''digital' ... I hit the key ... he he he.

Group,
HO-68 digital without a TNC ... using WISP with MixW.

I have WISP set up correctly on COM 1, I have MixW set up correctly on COM 3.
I have VSPE on the computer ... but cannot see how I connect COM 1 to COM 3.

There's a 'slight' possibility it *MAY* be due to my not understanding JE9PEL's Japanese ... or ... it could also have something to do with being entirely bone idle and thick as a brick ... (he means *STUPID*, folks.....GM1SXX).

C'mon !!!! ... how many amateurs read instructions ... and more to the point, how many understand! them.

Anyone care to enlighten me as to how I 'virtually' connect COM 1 and COM 3 together with VSPE ??.

Hello John and group

I try to explain the various Packet Radio modes:

If you want to work with your local BBS or the box on ISS, you can use every soundcard-packet-radio-program which handles 1200 bps AFSK AX.25 Packet Radio.

- 1200 bps is the speed of 1200 bits/second
- AFSK is the modulation Audio Frequency Shift Keying with Bell-tones (1200/2200 Hz)
- AX.25 is the communication protocol (X.25 for Amateur Radio)

This is the archetype of Packet Radio.

With Fuji-OSCAR-12 came the "Fuji-Mode" with Manchester encoded FSK (MFSK) in the
uplink and Binary Phase Shift Keying (BPSK) in the downlink. MFSK is modulated with
FM, BPSK is demodulated with USB. AO-16, WO-18 (only downlink), LO-19, FO-20, IO-26
and FO-29 used also this *Fuji-Mode".

Douglas Quagliana, KA2UPW, wrote the program UPW for MFSK uplink to send APRS
formatted Packets via the "Fuji-Mode"-Satellites (remarked above).

There is also 9600 bps FSK which I don't further explain now. This for MODULATION,
now the COMMUNICATION PROTOCOL.

Packet Radio uses the AX.25 protocol. For the PACSats Chris Jackson, ZL2TPO (G0???),
wrote the PACSAT-protocol at the Univerity of Surrey in Guildford and implemented
it into his program WiSP. This protocol hooks up as additional layer on

AX.25 and
is used from AO-16, WO-18, LO-19, IO-26 and new HO-68.

HO-68 uses common AFSK 1200 bps Packet Radio but with the PACSAT communication
protocol. Nader found a software solution for WiSP and MixW with a virtual com port
program, if I remember me right.

I hope, this explanations helps you to understand the whole "menagerie". I knows
that many OMs, also programmers, are confused with the notions and produces
mistakes. But we HAMs are communication specialists and should be more careful
with items and notions.

Thomas,
An easy to understand and well written explanation of the different methods
of packet on satellites.

I understood it very well. Thank you.

Yes, i used the setup from Nader's Blog but unfortunatelyi didn't understand how to
get my two COM ports (1 and 3) to talk to eachother with the VSPE program.

I suppose I'm going to have to bite the bullet and actually read !! the instructions.

Work.

Arghhhhhhhhhh !!!!!!!!

As GM1SXX would say ... "work ... the scourge of the drinking classes"
(With due apology to Oscar Wilde).

73 John. <la2qaa@...>

3370. HO-68 FM.

Yahoo group: eu-amsat
Date: 2010-04-27 17:50:46 UTC
From: John Hackett
Topic: 3370 Message: 3370

Group,
After having just listened to the FM pass of HO-68 (270420101900Z) I stand by my previous comments ... in a word, well, two actually, complete chaos.

We're all aware of the stations with poor receiving equipment but for the *BIG GUN* stations ... there is absolutely no point whatsoever in calling 'CQ satellite' on top of two stations who are already exchanging reports.

The QRP technique of 'tail-ending' is all about 'timing' - (remember the tail !!).

Attempting to stomp into the transponder when it's already in use only increases the chaos factor ... yessssss, we all know about it - so why does it continue ??.

All we can do is repeat over and over again that FM is a *ONE AT A TIME* mode due to capture effect - (usually, the strongest signal wins) - until it eventually sinks in and people start to practice 'operating technique'.

The idea on FM is to give your callsign, a report and your locator ... then let somebody else have a go ... as opposed to long-winded discussions about your stomach pains.
I can assure you, 99.99% of us really arn't interested in what you had for breakfast.

FM via satellite, by it's very nature is a 'contest' type mode, not a rag-chew mode.

Your local repeater is the place to 'entertain'' people with your life story.

Apologies for the 'sour grapes' ... they give me indigestion ... and frustration.

73 John. <la2qaa@...>

73 John. <la2qaa@amsat.org>

Topic: 3371 Message: 3371

Nader,
I'm about to demonstrate my computer illiteracy - (ignorance).

HO-68 ... WISP ... MixW ...

Do I just give both WISP and MixW the same COM port number ... (for instance, COM 2)
then put COM 2 into VSPE and start the emulation ??.

Then ... when HO-68 appears - (in PACKET mode) - start WISP, MixW and the
VSPE emulation ??.

Will WISP then perform 'automatically' ??.

(Both programs are set up correctly, new keps etc).

'Other' stations will *NOT* be excommunicated from the group if they answer the query.

John, I would say ... correct. It sounds logically to me. Have you set it up successfully now or is this your question ?

As you eventually knows, I'm using a hardware TNC and have not such problems, hihi. :-)

Hi Thomas,
Yes, the last time I operated packet on a satellite was many years ago
with a PSK1 modem ... also, an MFJ 1278 with a G4RUH 9600 bps card added.

Setting up *without* a TNC is new for me ... but it appears to be working correctly.

At first MixW REFUSED! to operate with VSPE but after I changed the COM ports it was OK.
There was obviously some conflict with my Bluetooth ports.

Not being a 'computer' man - it took me a while to figure it out. Now it looks to be
working OK.

I still prefer QRP CW via satellite though (ex army telegraph instructor) ... the original
'data' mode.

I recently moved into a place for old people so my 'array' is a *LOT* smaller now than it
used to be. Still, the QRP and small array make it a challenge. I have enough 'countries'
and DXCC''s from the 1980's sunspot cycle so I don't need anymore 'wallpaper'.

Brag tape.

I was G-QRP 74. One of the first IOTA stations and RSARS (Royal Signals Amateur
radio Society) 1654 ... so I've been playing radio for while - (1966) - 44 years so far.

Thanks for taking the time to answer Thomas, very much appreciated.

Have a good day!.

Hi OM John
You almost done!

Note the sound mixer setup!try to listen to the packet via PC speaker and on air.
Human ear can detect any sound but the bird BBS and WiSP are not!
Take your time and enjoy testing your setup OM.
see u on BBS John.

3380. Santa Isabel Island Dxpedition (Including Satellites)

Yahoo group: eu-amsat
Date: 2010-05-01 18:18:10 UTC
From: ps8rf
Topic: 3380 Message: 3380

Hello Friends,

The team of Teresina DX Group and Labre - PI is preparing a DXpedition to the Santa Isabel Island (IOTA SA 025 DIB PI-01) and Pedra do Sal Lighthouse (ARLHS BRA-070, DFB PI-03) in the coast of the state of Piauí in northeastern Brazil.

Call Sign: ZW8B

02º45" S * 41º45" W

Grid Locator: GI97de

The DXpedition Will be starting the 16:00 UTC the day 02 to 06 of june 2010.

The operations include bands from 160 to 10 meters (SSB, PSK31 and RTTY), including 6 meters, 144 MHz (SSB / FM / CW) and the satellites (SSB / FM / CW): AO-7 (A and B), FO-29, AO-51, VO-52, SO-50, HO-68, SO-67 (if active) and ISS in repeater mode if active. We Will Be in all orbits, please track your favorite satellite. We will be there.

QSL via PS8HF

MILTON LIMA RIBEIRO
RUA MAZERINE CRUZ, 2673
64076-040 TERESINA - PI,
Brazil

The Team

PS8BBC, PS8DX, PS8ET, PS8HF, PS8NF,
PS8PY, PS8RF,PS8TV.

Equipments for Satellites: (Exclusives for Satellites Comunications)

TS 2000X and TM-D710
2x7 for 2m (Home Made) with preamp
436CP30 for 70 cm (M2) with preamp
G5500 Rotator
FD ST2 Satellite Antenna Tracking Interface

http://teresinadxgroup.blogspot.com/

Video: http://www.youtube.com/watch?v=95sAEhALejs

Santa Isabel Island Pictures : http://www.parnaiba.com.br/pedra_do_sal.htm

We would like to receive the cooperation of the Control Team of the satellites: AO-51, HO-68 and SO-67 to facilitate the operation modes or activate the satellites when the footprint of them are reaching the island, including activations in

their schedules during the DXpedition. We will be grateful.

73' and Good Dx'

Teresina Dx Group

3381. Area Coordinator.

Yahoo group: eu-amsat
Date: 2010-05-02 14:06:19 UTC
From: John Hackett
Topic: 3381 Message: 3381

Group,
I have been asked by Camsat, and have accepted the post as area coordinator for HO-68.

Questions pertinent to HO-68, particularly scheduling and special requests may be directed to me and I will mediate with Camsat.

It has already been asked on the Amsat-bb how the scheduling for HO-68 will be *AFTER* commissioning is completed. As of this writing that is still to be determined.

73 John. <la2qaa@...>

3383. Future HO-68 schedule.

Yahoo group: eu-amsat
Date: 2010-05-03 07:17:55 UTC
From: John Hackett
Topic: 3383 Message: 3383

Group,
I would appreciate it if as many as possible would send me a short note stating their preference for the future scheduling of HO-68 ... CW, SSB, SSTV, FM voice, FM digital - (not necessarily in that order).

It's a well established fact that most Americans prefer FM - (the newer operators having been weaned on it) - while in general, the majority of Europeans prefer SSB and CW, with 'digital' and SSTV.

It's also being taken into account the countries that have (as yet) very few operators ... and these may only have FM equipment.

Over such countries, there is very little QRM to disturb FM whereas over Europe, FM is a 'zoo' and very few people can get into the satellite. In linear mode however, over Europe, at least, a lot !! more stations are able to use the satellite.

Your input would be appreciated ...

Callsign and preference please ... (SSB, CW, FM, DIGITAL, SSTV)

At this time, there is no information as to the length of commissioning nor the schedule format on the completion of commissioning ... ergo this request!.

73 John. <la2qaa@...>

Hello John

-->
HB9SKA's preferences:

1st Linear transponder
2nd FM repeater with SSTV (needs especially much discipline, otherwise
its not possible to receive a whole picture.)
3rd Packet Radio (PACSAT)
4th FM repeater with voice
<--

Thanks for your work.

Group.

FYI.

HO-68 will have it's own page on the OBSERVATIONS website under the heading 'Observations From China'.

<http://www.observations.biz>

73 LA2QAA & GM1SXX.

3388. DX

Yahoo group: eu-amsat
Date: 2010-05-04 19:27:42 UTC
From: John Hackett
Topic: 3388 Message: 3388

Group,
For those not aware of the DX possibilities of HO-68 check out the orbit for 050420101828Z - (the fifth of May 2010 at 18:28 UTC) - from Svalbard in the north to The Sudan in the south and from Portugal in the west to Pakistan in the east.

Well over 50 countries on a single pass covering the northern half of Africa, the whole of Europe, The Middle East and part of Asia.

For the 'whingers' ... be glad you're not located in South Africa where they have countries with few or no operators to their north - and sea! to their south west and east.

HO-68 will now have it's own blog on the 'OBSERVATIONS' website.

<http://www.observations.biz>

GM1SXX does all the work ... LA2QAA takes all the credit.

73 John. <la2qaa@...g>

With a little more "push" is it possible to have just a slightly elliptical orbit? I don't know what brand of batteries they put in VO-52
but they probably put a small pink rabbit in it as they don't seems to bother too much with their power budget...

What's is funny is the commenting on the perf board model AMSAT-India was showing couple of years before the launch of VO-52, some where
commenting on the jumper wire perf board modelling as if it was not something who will never be able to work...

AMSAT-INDIA just doing an excellent and professional job on VO-52 they even put 2 transponder in the same satellite "too strong never
broke". I'm convince their new orbit will cover quite some area on earth..

No problem to repeat :)
Today 05:18UTC, when KO84 was under footprint of FO29 and AO7(which in mode A today) we made QSO with HB9CAT, who work via AO7 cw. I work cw via FO29. Signals was strong but different doppler direction give a some disadvantages. But it work... I will try to do the same on SSB, but don't khow when :)

If you carefully read, AMSAT-India has 2 Linear-Transponders ready
and not a satellite. As you knows, the satellite VO-52 itself was built
and contributed by ISRO to AMSAT-India.

If you want a satellite in HEO then support Phase-3E from AMSAT-DL.

From: John Hackett
Topic: 3393 Message: 3393

Group,
HO-68 is just fine with QRP.

Two of this evening's CW QSO's were with 2.5 watts from a 22 year old FT-290 transmitter to an 'Arrow' aerial. Receiving on an TR-851E, no preamp, using manual doppler tuning.

For the other two QSO's I used *SUPER-HIGH POWER* of 80 watts.
(FT-290 - homebrew class C amplifier - Arrow aerial)

If anybody noticed the difference - they didn't mention it.

THERE'S A LESSON IN THERE SOMEWHERE.....LA2QAA

Exactly Bruce

The 4 key words are: With a little more "push" and 'slightly elliptical orbit'

This will not replace in anyway an HEO the ultimate goal but in the mean time a MEO will give us some releif of our dull environment.

P.S. Dull in the sense of the same usual earth path!

Hello Bruce

I missed also something of this discussion. I'm only a digest-reader of the AMSAT-BB mails. Sometimes its a problem for me when Luc copies fragments of discussions into the EU-Amsat group.

Domenico's mail was irritating. AMSAT-India does not plan to launch a new satellite, they are looking forward, if ISRO would be so kind to offer a new satellite structure for their 2 transponders and a launch into a higher orbit. I wish the OM's from AMSAT-India good luck and success for this project.

I'm not a specialist for orbits and rocket launches, but every orbit is better than a LEO-orbit. I'm aware of that such launches are much expensive than a LEO-launch. There were thousands of discussions about HEO-satellites, but Luc wrote a very important thing. If we all AMSATers do not pull at the same string, we would never have such a fantastic satellite like P3E in a HEO. I hope my fellows from AMSAT-DL have anyhow success with P3E and the cooperation with DLR (www.dlr.de).

Thank You for your support of AMSAT-DL.

3396. PL 67 Hz for AO-51 Mode S

Yahoo group: eu-amsat
Date: 2010-05-06 06:56:53 UTC
From: murrayhely
Topic: 3396 Message: 3396

I have a very old FDK Multi 2000 for the uplink on 145.880 . I am a SSB Linear Transponder person. NOT FM Satellite person but I have to have a go at Mode S !

Question ??????

Can you use your sound card to generate the low level 67 Hz tone required and feed it into the microphone socket with your voice at a low level or does it have to be feed in further back in the decimator ?

Murray ZL3MH

Hello Murray

I have also an old Kenwood TS-711E and feed the soundcard into the data socket at the rear. You can try to feed it into the microphone socket. I also heard that an OM feeded the tone via PC-loudspeaker into his microphone. But this is unstable I think. If you have an entry point to the discriminator you have to adjust and measure the hub. I've done that in the 1990s for the 9600 bps PACSATs UO-14 and UO-22, KO-23 and KO-25 and later GO-32.

But on the 145.880 uplink of AO-51 you don't need the CTCSS-tone, only on the main V/U repeater. If you are never QRV via the FM-sats then you are ready.

From: murrayhely
Topic: 3396 Message: 3398

Hi Thomas, I have been working on it tonight.
Last time there was No PL 67 Hz tone needed
on Mode S. This time it says you need the tone.
I am running it out of the sound card into a
600 ohm to 600 ohm transformer in series with
2,2k resitor to stop the microphone getting
loaded down and into the radio. There are now
about 6 of us on Mode S. 2 in ZL and about 4
in VK. I hope this time to work from Christchurch
(ZL3) to Western Australia Perth (VK6) around
5000KM

All the best Murray ZL3MH

3399. HO-68 SITREP 080520101743Z

Yahoo group: eu-amsat
Date: 2010-05-08 18:21:48 UTC
From: John Hackett
Topic: 3399 Message: 3399

Hello Al,
This is ridiculous!.

I was *BOOMING* !!! in at just 1.5 degrees elevation (102 degrees Az) so I turned off the half-knackered RFC 2-217 and went QRP 2 watts ... FT-280RII bare-arsed (he means barefoot - or, perhaps - bear! foot).

So what !!! ... still 579.

Maybe I should short out the FT-290RII's PA transistor and start milliwatting ??.

I really *MUST* laugh at the 100w/10 element/auto doppler tuning wankers.

I miss my large array but seem to do OK from the new QTH ...

NB.

For the non-aerial experts ...

A 3 element Yagi like the Arrow (used here) has an almost 60 degree half power beamwidth in both the vertical and horizontal planes so is ideal foe LEO satellites.

I have a seperate 7 element Yagi for RX mounted 1 meter above the Arrow (The Arrow is used for TX only) and is boted to the wall of the old people's home at the *GREAT* height of 9 feet, *PRETENDING* to be a TV aerial - (see pic) - since any form of radio amateur aerial is *STRICTLY* 'verboten'.

(I made an official application and was refused).

Therefore ... all contacts are via my "TV" aerial.

From: John Hackett
Topic: 3402 Message: 3402

Nader,
As you can see from the attached pic, I'm getting there ... slowly.

The QRM from F0FVK didn't help of course.

Sylvain, the HO-schedule on the 17:21 UTC pass was specified for *PACKET*.

There are only a few dedicated packet passes so continually calling CQ on voice is *NOT* very helpful.

When nobody answers you after 10 calls (including blowing into the mic) it's time to ask yourself 'why' nobody answers.

The schedule was published on the EU-Amsat reflector and the Amsat-bb at 07:00 this morning - as well as on Mike's blog and the CAMSAT webpage only a short time later.

Most of the rest of the week *IS* dedicated to FM voice ... with a couple of slots for SSTV.

Hi John

C91HLT is doing well into South Africa with his portable FM equipment but it
would be great if he could work a few European stations when he reaches the
northern end of his trip.

So far John has just worked into South Africa and Reunion Island using both
SO-50 and AO-51.

My internet is out of action at the moment and I have my laptop at my
neighbor's QTH where I can send emails and check for incoming stuff once or
twice a day.

RE: HO-68?

From:

Hal Lund ZS6WB (zs6wb@...)

Sent:
Tuesday, May 11, 2010 11:45:11 AM

To:
la2qaa@...

Hi
John

I have had
very limited access to internet since about Friday with my network
system down.
I have had no HF communication with C91HLT this week and have
also had no way to get the HO-68 schedule to him. We had planned to use
SO-50 but the times are too early and passes are while he is still on
the road
and most ZS operators are still at work. We will probably lose out on
grids this
week and maybe hear him on SO-50 during the weekend, then go back to
AO-51 next
week.

He is still
pretty far south for Europe even on HO-68 but will try to get him ready
for the
next HO-68 FM schedule by which time he will be further north. The best
time
will be when he gets up to the north end of
Lake Malawi.

Thanks for
the help on the scheduling request.

Why don't you
help us get the word out to the European DXpeditioners that are coming
to Africa
to bring satellite equipment along, even minimal FM equipment to help
satisfy
the locals starved for a few DX QSOs. We will return the favor, I
promise.

Hello

Al,
I
posted a note to the EU Amsat group to keep their eyes peeled for

Mozambique.

I trust you noticed the HO-68 schedule appeared
several
hours earlier this time,
(I posted it on EU Amsat at 07:00Z this
time).

3407. C91HLT news.

Group,
Here's the latest news for the African satellite DX.

73 John. <la2qaa@...>

3409. RSOISS SSTV Pics

Yahoo group: eu-amsat
Date: 2010-05-14 20:20:33 UTC
From: murrayhely
Topic: 3409 Message: 3409

Last night again I left my Computer with MMSSTV running connected to my trusty FDK Multi 2000 on 145.800 MHz to a J pole in the hedge and I was rewarded with 3 pictures from RSOISS in the Russian module. Best of all they were in Martin 1 which is more than double the resolution of Robot 36. They were received around 4.16 NZST this morning.

They are under ISS SSTV Photos and the photo is called "RSOISS 15_5_10"

Bye now ZL3MH Murray

> >
> >
```

Thanks John and Mike for the Kepler data. I've converted it to the AMSAT-format (own written software):

```
Satellite: Negai
Catalog number: 00000
Epoch time: 10137.91382380 (17.05.10)
Element set: 00
Inclination: 29.9660 deg
RA of node: 238.9027 deg
Eccentricity: 0.0000001
Arg of perigee: 120.7250 deg
Mean anomaly: 357.1250 deg
Mean motion: 15.90813690 rev/day
Decay rate: .00000000 rev/day^2
Epoch rev: 00
```

Also in Switzerland Negai will never be seen at 47.435278 deg North (JN47ck). I think Waseda-Sat2 has the same inclination and would also never be seen ?

3428. HO-68 FM

Yahoo group: eu-amsat
Date: 2010-05-23 19:16:49 UTC
From: John Hackett
Topic: 3428 Message: 3428

Group,
Once again, absolute chaos! reigned supreme on HO-68's FM pass this evening.

One French station calling CQ satellite on top of a 'flock' of other stations replying to a MEGAPOWER station ... and surely !! must have heard the others ... but just kept right on calling - as if 'persistance' was enough to get through the chaos ... NEWSFLASH - it isn't, particularly when everyone else is doing the same thing.

One stations *WAS* trying to be a bit smarter - by using the locator! as the fishing hook, "This is KO****" etc ... nice try, but when people figured it out they ignored him too.

I would respectfully suggest the words 'NET DISICPLINE' be looked up, read and digested before tomorrow's pass ... but even that is tatramount to spitting into the wind.

80% of the operators *DO* know how to operate on a net - (which is akin to an FM satellite transponder) - but they just totally ignore common sense and join the fray ... thereby making
it even worse.

Yes, I know !!! it's only a hobby but the question from my daughter ... Those !!!! are radio amateurs ??" ... prompted this mail.

I was ashamed to say ... yes, they were.

Agreed they aren't really suited to normal QSO's. It's why I prefer linear transponders that allow multiple QSO's.

But single channel FM sats can be great for demonstrations as shown in this example:
http://www.southgatearc.org/news/may2010/satellite_demo.htm

The simple equipment and good audio clarity of FM can make a very effective demonstration.

Linear sats aren't as good for demonstrating to the general public. People who are not used to hearing SSB find it hard to work out what is being said particularly if the Doppler shift is being corrected manually.

I hope one day someone comes up with a digital voice mode that has the clarity of FM but in a bandwidth of less than 2.4 kHz.

Group,
ND9M/MM is
operating on HO-68, sailing out of Bahrain.

He makes 2 x QSO's
then leaves it to the others ... *EXCELLENT* !!!! operating.

Please
!!!!! use common sense and *NOT* call on top of him.

The
stations working the same stations over and over again ... please give
others a chance,
there really isn't much point in working the same
grid again and again just because you have the strongest signal.

There
ARE mobile and portable stations trying to get through but these last
2 days they have no chance whatsoever.

100w to a 10 element yagi
is *NOT* QRP.

3432. Request help

Yahoo group: eu-amsat
Date: 2010-05-24 20:53:15 UTC
From: John Hackett
Topic: 3432 Message: 3432

Group,
Can somebody help please.

Normally, I only use CW on an old FT-290RII but I have an IC-E92D FM handheld in the junque box.

It has all sorts of setting a *THICKO* like me doesn't understand. The manual is in Janglish - (Japanese English) - so that's no help since it contradicts itselkf in the space of 3 pages.

What I need to know is ...

To work HO-68 on FM, do I set the rig to ...

1) TONE.

2) TSQ ... (tone squelch)

3) TSQr ... (tone squelch reverse)

4) DTCS ... ??

5) DTCSr ... ?? reverse

I *know* HO-68 FM requires 67Hz but I *DON'T* know if I should set the rig to "TONE" ... or to ... "TSQ" - (tone squelch).

You don't get this !!! problem when your only choice is between a 'dit' and a 'dah'

I thank you in anticipation of a reply to ...

<la2qaa2amsat.org>

Hello Thomas,
Thanks for attempting to help, very much appreciated ... but unfortunately, I'm still in the dark.

I know HO-68 FM (voice) requires 67Hz CTCSS but at which setting ?? - (I have 5 choices) this is, is what I *DON'T* !!! know.

The 'Janglish' - (Japanese/English) - manual is very confusing.

I have the choice between setting the rig to ...

1) TONE

2) TSQ ... (tone squelch)

3) TSQr ... (tone squelch reverse)

4) DTCS ... ??

5) DTCSr ... ?? reverse

I would 'guess' it is either "tone" ... or ... "TSQ" ... I've tried both but can't hear myself through the transponder - whereas I'm *BOOMING* !!! in on CW.

(I monitor myself on the FT-290RII so the IC-E92D *IS* transmitting OK).

So I'm still none the wiser ... "Tone" ... or ... "Tone squelch" for CTCSS on HO-68 ??.

Sorry to be such a 'pain' Thomas but 'modern' gear is not my forte' ... hi hi.

Which ... "TONE" ... or ... "TONE SQUELCH" ... ??.

Yahoo group: eu-amsat
Date: 2010-05-25 09:36:58 UTC
From: John Hackett
Topic: 3437 Message: 3437

Group,
In lieu of a dedicated HO-68 online log similar to the AO-7 Resource Page log,
GM1SXX and myself have set up an HO-68 Blog.

Among other things, one can post eQSLs so that others can see who's doing what to whom,
and when. Just post a pic of your eQSL ... or comment to either GM1SXX or myself at
>callsign@...<

There is also a DX warning, 'live' tracking and a comments section, plus a stack of other
HO-68 information.

The blog is part of the OBSERVATIONS page and can be seen at ...

<http://www.observations.biz/XW-1_BLOG/>

As per ... GM1SXX does all the work - LA2QAA takes all the credit.

Don't be shy, lets see what you've got.

The latest info on the African DX from Hal Lund ZS6WB.

Subject: [ZS-SAT] NEXT STOP MALAWI for ZS6XK
On Tuesday morning ZS6XK/C91HLT left the Gorongosa Game Reserve in Mozambique on the next leg of the journey which will take John into Malawi. The first destination will be Blantyre where John will be issued his new 7Q7 callsign. The current plan is to be in Blantyre on Thursday afternoon so hopefully we will hear John with his new callsign on Friday, but it is more likely to be on Saturday or Sunday.

Following the stop in Blantyre John and his wife will spend the next few days traveling to the northern end of Lake Malawi before crossing into Zambia.

Chris,
Thank you *VERY* much indeed. It's as I guessed - but I was starting to wonder since I couldn't hear my downlink on FM - even with 50w !!! ... while I had no problem whatsoever working people with 2 watts on CW.

Again !!!! there''s a lesson in there for the 'designers'.

I've taken the liberty of posting this to the group, I hope you don't mind ... in case someone notes something vis-a-vis linear v FM - (don't be daft !!!!.....GM1SXX).

Thanks again Chris. The group working as it was envisaged.

Exactly my point John, I have tried many times to use the FM transponder to access the bird however not even a blip!

I am building my linear station, but can only work it portable as no way I can get antennas up on the house.

It☐s very hard to hold and tune with an arrow in the other as well as speak!

Thanks,

Chris

Hi John,

It☐s going to be the tone setting.. however, good luck getting into HO-68 on low power on FM, I have tried many times with my 5 watts and an arrow and it☐s almost impossible to do it!

The big guns and small ears :0

Me its small ears and small gun!

Thanks,

Chris

Hello Thomas,
Thanks for attempting to help, very much appreciated
... but unfortunately, I'm still in the dark.

I know HO-68 FM (voice) requires 67Hz CTCSS but at which setting ?? - (I have 5 choices) this is, is what I *DON'T* !!! know.

The 'Janglish' - (Japanese/English) - manual is very confusing.

I have the choice between setting the rig to ...

1) TONE

2) TSQ ... (tone squelch)

3) TSQr ... (tone squelch reverse)

4) DTCS ... ??

5) DTCSr ... ?? reverse

I would 'guess' it is either "tone" ... or ... "TSQ" ... I've tried both but can't hear myself through the transponder - whereas I'm *BOOMING* !!! in on CW.

(I monitor myself on the FT-290RII so the IC-E92D *IS* transmitting OK).

So I'm still none the wiser ... "Tone" ... or ... "Tone squelch" for CTCSS on HO-68 ??.

Sorry to be such a 'pain' Thomas but 'modern' gear is not my forte' ... hi hi.

Which ... "TONE" ... or ... "TONE SQUELCH" ... ??.

73 John. <la2qaa@...>
.....

The best way to try out CTCSS via satellite is via SO-50.
If you have a nearby terrestrial repeater with CTCSS this
would be much better.

OK, its not "DTCS", its a digital squelch I think.
"TONE" could be the 1750 Hz tone for repeaters/relais.
So we have "TSQ" tone squelch. The one is to open and
the other is for opening, if you have another HT with

the same function.

Try first "TONE". If you hear a 1750 Hz tone on your
FT-290 then you can exclude "TONE". Then try with
"TSQ". I think "reverse" means "receive", this would
make sense. "To receive" a tone or digital frame for
opening the own HT.

Hrm,
Short of throwing together a 5kW amplifier I think I'll stick to flea power on CW.

It works !!!! ... see the HO-68 (b)log at ... <http://www.observations.biz/XW-1_BLOG/>

Just kidding ... I'm not a fan of the - 'Mine's bigger than yours!' - syndrom. I'm more of a
William of Occum follower - "Tis vain to do with more, what can be done with less". More of a challenge. Any eejit can wail a microphone but to communicate with CW require at least three (3) obligatory braincells working in tandem ... dit, dah, space

The FM game only requires an ON/OFF switch ... (usually with brain OFF).

Before you start hitting the *DISAGREE* button folks ... it's only an *OPINION* from an old f*rt when didn't cut his license from the back of a cornflake packet ... (read: 'tick box mentality).

My opinion is that when people had to sit a proper exam to get a license, the standards were quite a lot higher ... as was the operating proceedure and general conduct.

Swearing was frowned upon ... I'm told that these days 'street language' is perfectly acceptable to OFFCON ... sorry! ... OFFCOM ... psst, wanna buy a frequency ?? ...

It's hard to distinguish the wheat from the chaff these days. ...

The website works, and there have been no strange things downloaded ;-)
Sophos is, IMHO, overprotective, even if in general universitary web
sites are to be taken with a grain of salt.

Hello John,

Hal, ZS6WB, forwarded your posting to me about your remarks concerning my operating on HO-68. Many tks for the compliment.

Although I've been on HO-68 only a few times in this part of the world, the operating conditions you referred to occur in the USA regularly as well. The same ops check in with each other during every pass.

I have not seen that happen in this part of the world though. It's probably because I am far enough south that by the time all of EU gets on the satellite, the pass is ending for me anyway.

The first few HO-68 passes that I operated were with full duplex; my rig was a Yaesu FT-897D for TX and an FT-817ND for RX with an Arrow-2 yagi. Yesterday, I accidently reversed the power leads to my 817, so it will not be available to me until I reach Diego Garcia where my ship is heading.

So now I am using the 897 in half-duplex mode. It is not as easy of course, but the packet bursts from HO-68 help me with aiming the antenna and tuning the RX.

I worked several EUs while in the Persian Gulf, but I am sorry that I did not work you.

I will try AO-7 tomorrow when it is in Mode B. My ship and LA-land will both be in the footprint at about 28/1356Z. Perhaps we will work then.

73 for now,

Jim, ND9M/MM / VQ9JC

Hi Group.

We seem to have attracted a few new members lately so I'd like to take the opportunity to welcome the new guys and to say that this is *your* reflector, for discussion of matters satellite related. Although it is a moderated group, we do encourage original thought, so don't be afraid to think outside the 'official' box. Original thought is welcomed.

This group is not subject to censorship, with the only caveat that we do reserve the right to delete any message that is deemed grossly offensive by the moderators. With that over I'll say that this group has now been running for five years and now has a membership of 184 people. Well done folks, and keep up the good work.
If you have files of photos to post, please try to make use of existing folders where possible to post stuff, to linit the number of folders.
Keep up the good work.

Hello All,

On June 1 a part of the team ZW8B arrives in Santa Isabel Island. Our intention is to work a greater number of days in the communications via Satellites. Our prediction is that we are still active in the satellites in the early evening of June 1 in the satellites AO-51 VO-52, SO-50, FO-29, SO-67 (if active), HO-68 and AO-7 A and B. It's a good chance to work via satellite, a Brazilian amateur station and a rare grid. We hope to make a grand party of DX , especially for the community of satellite operators.

3452. An experiment.

Yahoo group: eu-amsat
Date: 2010-05-28 16:22:56 UTC
From: John Hackett
Topic: 3452 Message: 3452

Group,
After an absence of over 12 months on AO-7 ... and in sheer disgust at zoological operating proceedures on the non-linear satellites I decided to see if anybody could still copy my QRP CW signal on AO-7.

Before the pass I informed GM1SXX of my intention - to make sure there were no prearranged 'sked' type contacts.

(Which there wern't).

VQ9JC operating as ND9M/MM requested a sked on AO-7 but that was on SSB.

The equipment comprised ...

TX: TR-851E on low power - (2w) - no CAT, manual doppler - (minimal on AO-7).
RX: 22 year old FT-290RII, no preamp.
6 element homebrew yagi to transmit CW on 432.150.
3 el yagi (Arrow) to receive on 145.942

Aerials mounted on a small rotor outside, on the window-frame at ground level ...
(disguised as 'TV' aerials since my new QTH is a no aerial zone).

Some of the stations answering my CQ were ...

Orbit 62612 9A2EY
Orbit 62613 UA9CS, RW9SL, F2IL
Orbit 62614 UN7CY, 9A2EY

The point of the experiment was to show ...

1) The above stations have ears !!! ... and use them - (well done! chaps)

2) You do *NOT* !!! need a lot of power and sophisticated equipment.

3) You do *NOT* need to 'wait in line' until somebody decides to let you in on FM.

NB.

None of the stations were told I was operating QRP.

I can only conclude that there's an *ENORMOUS* !!!! difference in the standard of operating between the zoological operators (FM) and the CW operators (they actually listen !!!! before they 'speak').

Don't forget chaps, the majority of FM operators *ARE* using full duplex rigs so there *IS* no logical excuse for the bedlam ... other than poor receiving equipment coupled with operating proceedure.

3453. Experiment Findings

Yahoo group: eu-amsat
Date: 2010-05-29 14:39:26 UTC
From: Al
Topic: 3453 Message: 3453

Hi Group,

LA2QAA uses a satellite antenna system disguised as a TV antenna.... a small one, consisting of an Arrow antenna placed on an azimuth rotator mounted on the outside wall of his flat in Ornvika (Kristiansund, Norway). The rotator can only scan a small angular swathe of sky before the elements collide with the house wall. In any event, he lives in a fjord, surrounded by *big* hills. He used two watts on the uplink to AO7 but inadvertently left the antenna pointing in the wrong direction when he made his QRP OSO with F2IL in France. He still managed to make the contact.

So to recap...2 watts CW on the uplink to a low gain antenna and the antenna not even pointed at bird. Signal report from F2IL... 549 with QRM.

While FM operating positively encourages high power, to beat capture effect, often usually allied with bad manners, operating linear birds works best with the opposite technique, 'low power and good manners'.
FM only allows rubber stamp type QSO's at best, so of course some people get bored with it want to migrate to linear birds where more normal QSO's can take place. Can anyone see a small problem here? A tiny little fly in the ointment?

John sent me a copy of his E-QSL from F2IL. I posted it at....
http://groups.yahoo.com/group/eu-amsat/photos/album/1368350666/pic/1741417331/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc
If the link doesn't work for you, just go to the photos section.
Low power works well on linear birds, even with modest antennas.
Always has done, so why do so many people run such high power levels? I can only assume that they have lousy receive systems and think that by shouting louder, they will somehow compensate for that. It doesn't work :-) For those with decent RX system who are also equipped with ears... I salute you.

Have a good weekend.
73 Al.

3454. NEGAI* via skype

Yahoo group: eu-amsat
Date: 2010-05-29 15:38:41 UTC
From: Mike Rupprecht
Topic: 3454 Message: 3454

Hi Group,

Today I made an exciting experiment together with my friend Tetsu san JA0CAW.

Since we can't hear NEGAI* in Central Europe we established a live link between our stations.

Tetsu gave me access to his PC via remote control (VNC) and I could control his transceiver.

We established a second connection via skype for audio.

The audio quality was excellent and I could hear NEGAI at a 10 deg pass over the Pacific Ocean :-)

See here: http://www.dk3wn.info/p/?p=15176

Nice one! Mike,
I used to do this with W0EEC, now N1DID Emily, though nothing quite as
'exotic' as NEGAI.

People can also use remote base stations to work satellites in other parts of the world.

I don't know if ther Australian one is still operating, several years since I used it. It was
set up specifically for AO-51.

It was a 'LOT !!! easier to work down under than in Europe. You can control the az:/el: rotor
'down there' from your computer 'up here'.

Anyone wanting to try it just Google - REMOTE BASE STATIONS.

73 John. <la2qaa@...>

Topic: 3456 Message: 3456

As a newcomer here, I just wanted to say hallo. I've been playing with sats for quite a while, but it's not until now I've got really bitten by the bug, hi! Right now I'm QRV on the FM LEO's, such as AO-51 and SO-50. I've heard HO-68 once, when it was passing right over my head, with the strongest signals I've ever heard from a sat - still it was impossible for me to get any contacts, as the bird was completely blocked by high-power operators from central and eastern EU. Still, I've managed to work quite a few stations on AO-51 and SO-50 with my modest QRP setup; VX-7R @ 5W into a 145 MHz turnstile for the uplink, and my old trusty FT470 into a 435 MHz turnstile for the downlink. This works amazingly well. Antennas are homebrew, using PVC-tubing and the elements are made of aluminium welding rods.

For portable work, I've built an "Arrow style" yagi for 145/435. elements on 70cm and 5 elements on 2 meter. This one is also built by using PVC-tubing and welding rods, and is based on DK7ZB's ultra-lightweight construction plans. The whole thing is mounted on a camera tripod, which allows for both azimuth rotation and elevation.

Right now I'm planning to build two small X-yagis for 145 and 435 MHz, which I will mount on the roof on an small TV-rotator, and fixed elevation of about 25-30 degrees. Think this will be fine for some QRP SSB and CW work on VO-52 and AO-7. I have 2 x FT-817, which I think will work fine for the up and downlinks on SSB/CW.

I,m uploading a few photos of my antennas, which can be found in the album named LA2MOA.

Cu on the birds!

73!

On behalf of the group,
We'd like to extend a hearty welcome to LA2MOA and thank him for
his descriptive mail.

This is the kind of thing that 'IS* of interest to other operators is is welcome and useful,
allowing people to get an idea of what equipment is currently being used.

Remember, we run everything from Arrows to EME arrays - (LA2QAA to ES1RF).

TIP:

When HO-68 is in linear mode the operating is far more civilised.

Founders & moderators.

Hi John,

yes it is no new way but always a new experience J

We did a similar presentation with COMPASS-1 at the AMSAT-DL symposium last year. We connected Henks (PA3GUO) station via remote control software (Teamviewer) and in parallel via skype for the audio. We sent DTMF tones via skype and could hear the answer from COMPASS-1.

Anyway - it's a good solution to make signals available from satellites with low inclinations in our "northern" part of the world.

The more interesting point is now to experiment with other modes. For example - can we decode a AFSK signal transmitted by skype? Which modes are possible (maybe in up/downlink) with VoIP technology. It seems a new field for experiments is open :-)

Hi Mike,
I absolutely agree with you.

I found it most interesting seeing the difference in (amateur) operating proceedure between American and European stations on FM.

It was this practical experience that instigated my earlier comments regarding FM v CW/SSB.

I'm sure you've been having a look at the HO-68 blog and as can be seen - there *IS* some genuine DX. The 'trick' now is to get a lot more of the rarer countries operating because the average pass of HO-68 over Europe covers 50+ countries from Portugal to Pakistan, Svalbard to Sudan ... currently, covering Europe, Africa, the Middle East and parts of Asia.

I'm working on this trick "as we speak".

Obviously, an HEO is better for DX but we have to work with what we've got.

I'm trying to get some answers from Camsat re: the schedule because while the Americans seem to prefer FM, it's my contention that most of the European operators would be happier with 25% digital, split between PACKET and SSTV (for the SWL's), 25% FM (for the newcomers) and 50% for the more experienced operators - with the schedule timing taking into account the 'active' DX operators like ZS and VQ that have been operating on HO-68 lately.

Anyone seriously disagreeing with the above suggestion is welcome to drop a line to the reflector and air your thoughts.

3460. Uplifting(!) morning on AO-51

Yahoo group: eu-amsat
Date: 2010-05-31 06:07:40 UTC
From: LA2MOA
Topic: 3460 Message: 3460

This morning I experienced the best results I've ever had on AO-51. Ok, the sat passed right over my head (max elevation was 89 degrees, hi), but with my QRP-setup into turnstile antennas, I managed to work no less than 6 new stations (and grids) within 5 minutes - between 0720-0725 local time. And yes, there was plenty of room for everyone to work eachother. Seems that the LEO's are much more crowdwd during the weekends. Lucky me, who starts to work in the late afternoon every day.

Anyway, the stations who made me very happy this morning was:

UR5BFX in KN29tn
US1GBF in KN66hq
UR5ASF in KO61of
ES8SW in KO28jb
YO9GJX in KN25ud
IZ5FSO in JN53mk

Indeed, workin FM LEO's are much more fun when operating is relaxed and stations are not shouting CQ on top of each other. That really gives low power stations a chanse to actually be heard on the bird...

Heard on the bird... haha...

Hi
John

Working good
DX today, even without HO-68.

AO-51 is doing a great job.

On earlier
pass of AO-51 eight of us worked 7Q7HLT who is now in KH75pd and will
move
further north tomorrow.

At 1627 utc
tonight three ZS stations worked 5N50/ZR6DEA in Abudja, Nigeria
(JJ39RB).
This was great DX for AO-51 and watching the track after the satellite
moved
north saw that he could have worked all of southwest Europe initially,
then all
the way up to the northern part of the UK. If he got in there I hope the
guys
had good manners. Tell the guys to forget names and grids, just calls
and signal
report. Dean will be in Nigeria for about a week on this trip. I just
received a message from Dean saying the whole of Europe was calling
him

Another Dean,
ZD8DC is also due to become active from about 02 June for 2-3 weeks and

may be
on FM and SSB sats..

Good
hunting!

The one "true rule" is fine when your "Highest" frequency is your downlink frequency "The frequency you adjust at your transceiver"
and the ARRL satellite handbook is giving the correct way with AO-52 i will try to explain it below for the linear satellite.

Those who are fully auto doppler controlled always correct their uplink and downlink frequency to be at the same spot on the satellite to
maintain the same audio pitch. Under normal standard work we should all adjust the audio for "normal voice" but some prefer high pitch
voice and some low pitch voice. Auto doppler correction can be set to maintain your audio pitch preference but if the other station adjust
his station for a low pitch it can be annoying for some operator who prefer high pitch voice (Ore vice versa) but it can be corrected just
in cheating your RX base frequency a bit.

The main issue:

If you enter in a QSO with a fully doppler corrected station and you follow the "One true rule" it is fine but not if this highest
frequency is your TX frequency. When you adjust your uplink (TX) frequency you will change the normal frequency the receiving station PC
doppler tracking program is expecting. Those with full auto doppler correction should disable their RX auto correction and they will have
to manually adjust their downlink frequency when an another station is not auto correcting or manually correcting his uplink frequency.

The biggest impact when you don't adjust or that you manually adjust your uplink frequency is that you can drift over another QSO. The ARRL
Handbook is correct when they give the VO-52 example but they should give the explanation and this explanation is not easy to understand
for a new satellite user.

In an ideal satellite world all the users should use auto doppler correction. In a less than ideal satellite world all the user should use
uplink auto doppler correction and in the actual real time satellitte world be prepared for the worse... and be flexible...

There is also another chapter on the auto doppler correction when you will try to answer a CQ call but depending of your type of
transceiver and type of doppler correctrion software you will have to experience your own ways just take my station as an example.

My FT-847 in CAT mode does not send any data back to the PC (First version of the FT-847) the transceiver can only received data from the
PC and if i want to answer a CQ call i have to reenter the new uplink and downlink frequency of the calling station and try to tweaked them
during the QSO it is a lot of work on a 10 minutes pass...

There is a lot a flavour in the doppler correction world but IMHO the uplink frequency should always be auto corrected and if it is not
auto corrected the TX frequency should never be adjusted only if you drift on another QSO or if someone else is drifting on you. There no
perfect solution aside of the full auto doppler correction.

I'm using full auto doppler correction when transponder activity is low as i always ended up stepping over a lot of station and be stepped
on when there is a lot of traffic on a transponder. The worse case i saw was on AO-40 one fellow who was in full doppler correction ask the

other station to move away as he move over the other QSO'S telling he's having priority over the manual corrected stations...

A suggestion is it possible to have a section on a transponder devoted only for those who are using auto tracking in voice mode? lets say
the upper end section?

There is nothing perfect only imperfect solutions.

Topic: 3464 Message: 3464

May 31st 2010

Organization update for post of President and Vice President.

An emergency committe meeting was held on May 26th 2010 at the residence of VU2RMS, Ramesh as we had recieved request from the current President Air commodore Suby, VU2UV to relieve him from the post of the president citing health reasons. This was accepted by the committe and was proposed and accepted by the committe that VU2RMS, Ramesh take up the role of the president and lead the organization towards the vision and mission of AMSAT India.

It was also proposed by VU2POP, POP to request VU2VP, Dr. Ved Prakash Sandlas to take up the role of Vice President which was accepted by the committe and also by Dr Ved Prakash Sandlas when contacted by phone. VU2VP is an active Radio Ham and associated with the Indian Amateur Radio satellite programme from 1980's and an AMSAT India member.Detailed bio data and his achievements and contributions can be found at http://www.freewebs.com/vpsandlas/

Please join me in welcoming VU2RMS, Ramesh as the President and VU2VP, Dr.Ved Prakash Sandlas as the Vice president of AMSAT India and we would like to thank VU2UV, Air commodore Suby for his guidance and focus on the activities during his tenure, he will continue to be a member of the core committe.

Group,
Adding to Luc's post ...

Personally, I use manual doppler tuning on my 22 year old FT-290 and have never had any problem any any satellite from RS-10 and FO-29 to HO-68 ... (Modes B & J).

Some of the older equipment doesn't have a CAT interface.

I *HAVE* used full dopper correction with InstantTRACK and InstantTUNE but tend to fall asleep when operating because it becomes 'BORING'.

For me, sending CW while tuning and tracking manually is the 'fun' of satellite operating ... which is another reason I personally can't abide FM rubber stamp QSO's - you might as well use MSN or YAHOO while reading a book and eating an apple..

OBSERVATIONS FROM NORWAY. 010620101730Z.

A SATELLITE PREAMP.

Sometimes, a preamp can be useful - though if you have an effective aerial for LEO satellites and a half-decent receiver, you don't really need one.

For *REALLY* weak signals like EME they may be a "necessary" part of the station but for LEO satellite operating ... unless your aerial is about as effective as a rusty six inch nail with a 50 ohm resistor loading it ... you don't "NEED" a preamp.

However ... for those that are convinced they *DO* need one - but balk at the price of an ultra low noise gaAsFET ... which you only need above 2Ghz ... here's a design just for you!.

It uses a common or garden variety UHF transistor, the veritable BFR91. This transistor is *NOT* of the ant excrement variety but has legs even a novice can sizzle without frying the junction. This transistor is good up to the gigahertz range - or, as GM1SXX is wont to say ... gigahercles.

As we all know - or should! know, a preamp is most effective 'sitting' right behind the aerial (so as not to amplify excessive cable losses). To that end, this one is built into an aluminium lunchbox - to keep the rain and insects out.

NB.

Insects are the only things with antennae ... not! radio amateurs ... unless they're Martians.

The input is a tuned circuit with a prallel tuned air variable capacitor to allow for tuning for minimum noise.

* Be aware that minimun noise and maximum gain very rarely occur at the same point.

The output is *NOT* tuned ... to aid stability.

The DC portion is isolated from the RF portion and is bypassed with feedthrough capacitors.

An RF choke is provided for feeding DC up the coax for relay switched preamps - but in this one - which used for FO-29 only, there are no relays so the preamp is attached to the 70cm receiver permanently ... however, a 3 pole two way switch allows for switching the preamp off and allowing the RF to pass from the aerial to the receiver without amplification.

I do this because I find it interesting to see how often a preamp is *not* needed. Just like power ... (or lack of) ... it's of great interest to me to see how much *LESS* power is required as the satellite approached TCA - (time of closest approach).

Most satellite operators don't even bother to reduce power as the satellite approaches. At TCA, a 3Db reduction of power isn't even noticable ... THINK ABOUT IT.

It's a complete fallacy to think you need large aerials and a lot of power to work LEO's. You don't !!! ... however, good operating practice and a little bit of skill often make the difference between success or failure.

Try some QRP, you might find the challenge absorbing. You *KNOW* it makes sense.

Haven't checked if anyone else has mentioned this excellent service before, but anyway...

hamlog.eu is a very good online log service provided by a hungarian ham. You can easily upload your logs (in ADIF format) to create your own online log. A benefit for everyone, easy to check if "that" QSO was good or not, hi!

So, have a visit on www.hamlog.eu, check it out and upload your logs. I'm currently doing that (it's not complete and up to date), but if you like you can check my log on:

www.hamlog.eu/la2moa

Cheers,

Hans / LA2MOA

In the event that anyone at Camsat sees this mail ...

It would have been nice with a SITREP - (situation report) - about the weekly schedule for HO-68.

here are a *LOT* of people 'wondering' ...

I summise it has something to do with the President of China visiting the ground station and
Alan Kung being in the entourage ... but still, a SITREP would have been nice.

On behalf of the myriad of satellite operators in Europe I would apprecate some word on the current status of HO-68 ... at your convenience.

Thank you.

Hello John and Group

HO-68 has a CW beacon on 435.790 MHz which morses always the status
of HO-68. If you want to know in which operating modus the sat is,
you can "hear" it:

```
Call ID ID Ch1 Ch2
-------------------
BJ1SA XW XW AAA TTT -> Only beacon
BJ1SA XW XW TTT TTA -> beacon + Lineartransponder
BJ1SA XW XW TTT TAT -> beacon + FM-Repeater
BJ1SA XW XW TTT ATT -> beacon + Software Upload
```

Mike, DK3WN, has written a decoder program to see the status. After
you have "seen" or heard the beacon, you can switch to the linear-
transponder or FM-repeater if one of them are activated. Why do you
need a schedule on the internet ? This may be an auxiliary aid.

Hello Thomas,
Yes, we know that ... but to answer your question ... "because not everybody has time to sit monitoring every pass of HO-68's beacon".

To the best of my knowledge - the beacon, not Mike's excellent decoder doesn't tell us when the transponder is switched on ... (does it ??) ... which is why I said that a 'scheule' SITREP would be nice.

Hmm... why not ? I monitor every pass during weekends, except those
when I sleep or eat or I'm watching TV.

>
> To the best of my knowledge - the beacon, not Mike's excellent decoder

Wrong!! See my example below. Mike's decoder tells it in clear.

> (does it ??) ...

YES !! But in real time of course.

> which is why I said that a 'scheule'
> SITREP would be nice.
>
> 73 John. <la2qaa2amsat.org>

You are right if you need a forecast of the schedule.

Hi Thomas,
Well I for one - (and i assume a few others) - *don't* have time to monitor every pass of HO-68. Therefore, a schedule for me is an important aid in knowing when to plan my operating on this particular satellite.

If the transponder - (*NOT* just the beacon) - was switched on on every pass there wouldn't be any problem - and I would agree with you ... but it isn't - so I don't.

73 John. <la2qaa@...>

3475. XW-1 beacon and schedule.

From: Al
Topic: 3469 Message: 3475

Hi Group

I think what John is trying to say is that the beacon while helpful in knowing which mode is currently in use, does not give information about when mode changes will occur and which mode is to follow the current one.

It would certainly be more useful if the bird itself could send its own schedule via the beacon TX as was the case with the old UoSATs, with their OBC 'diary'. The bird is already executing the diary anyway, and so the OBC is already carrying all the data needed. Alan BA1DU, if you are listening!

Perhaps if there is to be a 'follow-on' bird after XW-1, such a system could be incorporated. 1200 Bauds AFSK in NBFM mode seems ideal for this (like good old UoSAT2), and is easy to decode. Just a short table of data which would only take seconds to transmit, but would be useful to the satellite users. A five second 1200 bauds burst of plain text on the beacon TX could do it all. Just my 2 pence worth. This *may* not be practical for XW-1, but could be worth consideration for future birds.

Topic: 3477 Message: 3477

Hello John.
I just listened to HO-68 orbit 2231 - (Nova designation).

Beacon ON - Transponder OFF.

I did get a mail from Michael Chen ... he CC'd it to the Amsat-bb so you probably saw it.

As I envisaged, the Camsat chaps have been busy. Alan will post the new schedule shortly.

73 John. <la2qaa@...>

3478. The Beacon.

Yahoo group: eu-amsat

From: John Hackett
Topic: 3478 Message: 3478

For those that may be interested ...

It struck me that perhaps some of the FM and/or non-code operators may be interested in the telemetry and current operating mode of HO-68.

To that end ... for anyone interested, here is a short tutorial on a telemetry frame from HO-68's beacon.

You *DO*check the beacon before operating ?? ... yes ?? ...

(What's a 'beacon' for?) ... KIDDING !!!!.

One telemetry frame consists of the following transmission sequence ...

(Start of telemetry frame)

Callsign = BJ1SA Dah dit dit dit, Dit dah dah dah, Dit dah dah dah dah, Dit dit dit, Dit dah

Identifier = XW Dah dit dit dah, Dit dah dah

Identifier = XW Dah dit dit dah, Dit dah dah

13 x 3 letter channels

For instance ... 1) AAA Dit da, dit da, Dit dah

2) AAA Dit dah, dit dah, dat dah

3) AAA Dit dah, dit dah, dit dah

... and so on until 13).

The second channel is the designator for the transponder - with the following telemetry.

Beacon only ..... = TTT Dah, dah, dah

Beacon plus FM transponder = TTA Dah, Dah, dit dah.

Beacon plus linear transponder = TAT Dah, dit dah, dah

Software upload ..... = ATT Dit dah, dah, dah

Identifier = XW Dah dit dit dah, Dit dah dah

Identifier = XW Dah dit dit dah, Dit dah dah

(End of telemetry frame)

Each of the 3 letter channels defines an equation - which in turn will tell you the temperature, power, and other vital statistics of the satellite.

As can be imagined, a record of this telemetry along the satellite's orbit is *VERY* useful information to the controllers.

Remember !! ... you should *NEVER* have a signal stronger than the beacon.

It's also your propagation reference - as well as giving continual information on the health of the satellite.

Mike, DK4WN has written an excellent little HO-68 telemetry decoder - (among very many others) - go to ...

<http://www.dk3wn.info/satellites.shtml>

... and look under SOFTWARE.

Have fun.

73 John. <la2qaa@...>

John,

which version of the decoder software do you use?

The software you can download from the CAMSAT website is pretty old. There was a mistake shortly after launch.

You can find always the newest versions of my software on my website www.dk3wn.info/software.shtml

73, Mike

Sorry John, "TTA" equates to "beacon plus linear transponder",
"beacon plus FM repeater" equates to "TAT".

> However !!! ... since I worked IK1FJI and UR5BFX on CW on that pass I

You have permutes it. You also can download correlatively documents here:
http://www.camsat.cn/index.php?option=com_phocadownload&view=category&id=1%3Axw-1&Itemid=77&lang=en
So the beacon you heard was correct.

Hi Mike,
Yes, there's a great possibility I *WAS* being a tit because I 'was' using the original Camsat PDF file to check the beacon channel 2 equasion - (copied by ear).

I wasn't aware there was an error in it.

I'll practice what I preach !!! ... and check.

Cheers Mike.

Subject: AW: [eu-amsat] Check !!!.

John,

which version of the decoder software do you use?

The software you can download from the CAMSAT website is pretty old. There was a mistake shortly after launch.

You can find always the newest versions of my software on my website www.dk3wn.info/software.shtml

73, Mike

Betreff: [eu-amsat] Check !!!.

Thomas,

You're right
about one thing ... one needs to check !!!.

I listened to the HO-68 beacon on orbit 2232 and the channel 2 telemetry was 001 (TTA)

which equates to - "beacon plus FM transponder".

However !!! ... since I worked IK1FJI and UR5BFX on CW on that pass I think we can

safely assume the beacon was wrong and unless I'm very much mistaken, the "Beacon plus linear transponder" has a 010 (TAT) designation.

Therefore ... until we get the schedule ... check !!!.

I'm sure that if I'm being a tit (!) somebody will correct me.

73 John. <la2qaa@amsat.org>

3484. La2qaa *IS* a tit.

Yes! Thomas,
I definately was !!! being a tit ... it must be the senility creeping in.

My apologies for giving out incorrect information. I stand corrected.

Good job somebody! here has half a brain. Thanks for the correction Thomas.

73 John.

Sorry John, "TTA" equates to "beacon plus linear transponder",

"beacon plus FM repeater" equates to "TAT".

You have permutes it. You also can download correlatively documents here:

http://www.camsat.cn/index.php?option=com_phocadownload&view=category&id=1%3Axw-1&Itemid=77&lang=en

So the beacon you heard was correct.

Al had good ideas in his previous mail. Packet Radio is on board of

HO-68 so it may be possible to send a weekly bulletin with schedule

in Packet Radio. Just a thought.

Hello group!

This morning I had a fine QSO with HB9XJ Hans via AO51. About an hour later I received a very nice e-mail from US1GBF Pavel, who had made a nice recording of my QSO with HB9XJ. I've uploaded the soundfile to this site, where it's to be found in the files/Satellite Zoo catalogue (filename: AO51_03062010.WAV), for anyone's amuse (abuse?), hi.

Really nice to hear one's own voice and how it sounds in The Ukraine!

Hello Hans and Group

Hans, HB9XJ, was my mentor for the satellite operations. In the late 1980s/1990s we were a fine little satellite-op group here in HB9. This was in the glory AO-10/AO-13 days. :-)

Hans is mostly QRV on SW today, tell greetings to him.

3487. Diversity.

Yahoo group: eu-amsat
Date: 2010-06-03 15:55:04 UTC
From: John Hackett
Topic: 3487 Message: 3487

Folks,
It's good we have diversity in the group.

Personally, I find FM satellites about as interesting as watching paint dry and would suggest
that they're misnamed as 'EASYSATS' ... simply because they're almost always overpopulated by alligators - (all mouth & no ears) - using far too much power, thereby not allowing the potential newcomers easy enough access.

This applies particularly in Europe.

The general standard of operating is far higher in America though they too have a few operators that tend to 'hog' it with their electronic stamp collecting.

As has been said so many times before, a single channel mode with capture effect is hardly the most sensible mode for an amateur radio satellite. For the newcomer I would recommend either the lower or higher end of the HO-68 passband using SSB - where the operating is more relaxed and there's room for everybody without having to play the *POWER* card.

Remember, high power *IS* detremental to the satellite - as well as it being anti-social behavour in satellite operating - i(f you don't know why, please read up on power budget management).

However, the above my personal opinion and as as I mentioned earlier, diversity in the group is a good thing ... coupled with good manners and common sense.

3488. Rotators control

Yahoo group: eu-amsat
Date: 2010-06-03 17:17:34 UTC
From: Codrut
Topic: 3488 Message: 3488

PstRotator - a program for antenna rotators control - just updated.
More rotators and more loggers are supported.

www.qsl.net/yo3dmu/index_Page346.htm

PstRotator handles almost every controllable rotator in common use: Prosistel "D" and "C", Easy-Rotor-Control, RT-21 and RT-20 from Green Heron, DCU-1 HyGain, RC1 MDS, Rotor-EZ Idiom Press, Yaesu Az and Yaesu Az/El GS-232A and GS-232B, M2 RC2800, AlfaSpid RAK Az and RAS Az/El, Easycomm, ST3 Fox Delta, Endeavour Electronics AutoTracker, ZL1BPU, EGIS, Create RAC825, VK5DJ, EA4TX, DL7AOT, LVB Tracker, PrimeSat, SARtek, SAT688, CX6DD, WinRotor FUNKBOX, SAEBRTrack, HD-1780 Heathkit.

PstRotator provides automatic tracking for satelites and EME, using for this WXtrack, WinOrbit, Orbitron, Nova for Windows, Sat_Explorer, SatPC32, WSJT, Z-Track, GJTracker, EME System, Trak_SM, or HRD Satellite Tracker.
For the moon tracking an internal algorithm can be used.

A lot of loggers are supported: VQLog, Win-Test, N1MM, MixW, TACLog, DXView, HamRadio Deluxe v5 (HRD Logbook), LOG-X, Logger32, Winlog32, Loki5ace, Logic8, HamScope, AC Log, nGenLog, Wlog2000, XMLog, MicroLog, GenLog, RCKLog, Swisslog, KST2Me, VHF LOG, KLog, EasyLog.

PstRotator supports multi-user remote control over TCP/IP.

Topic: 3487 Message: 3489

John,

I can somewhat agree with you - considering the fact that the LEO's has more or less been overtaken by high power operators with quite big mouths and quite small ears. However, as I understand it, the intention of the LEO's was not that they should be operated at these power levels. The intention was to offer the possibility to work via satellites with handheld transceivers and simple antennas. I don't consider the FM LEO's to be "easysats", in fact I think it's sometimes easier to work, and be heard, on the linear sats. Working AO-51 or even worse, SO-50, during a weekend with a hendheld transceiver into a turnstile is just as "easy" as breaking the K5D pileup on 20 meters with 5 Watts into a groundplane antenna.

I've been QRV on sats before, and worked about 40-50 QSO's on VO-52 with low power. I consider myself a CW-man. I just can't wait until my antennas for the linear up/downlinks on these sats are finished, and then I will have a ball. Anyhow, right now I'm stucked on the FM LEO's and I have to bare with the ZOO for a couple of more weeks. Sometimes it's a lot of fun to work these sats, and sometimes it gets very frustrating - just like amateur radio in general. It takes all kinds, even aligators...

However, the FM LEO's offers a good entry level for newcomers and I think that a patronising attitude against these sats and/or the operators maybe will scare away the beginners. Were all amateur brothers and sisters, and it doesn't matter if we're working on the linear sats or the flying repeaters.

Cheers,

Hans / LA2MOA

3490. RE: [eu-amsat] Re: Diversity.

Yahoo group: eu-amsat
Date: 2010-06-04 17:56:31 UTC
From: John Hackett
Topic: 3487 Message: 3490

Hello Hans,
Well, I did say diversity is good ... (twice).

Well, I wouldn't say LEO's were designed for FM 'or' newcomers.

None of the RS series of satellites had FM on the 'AMATEUR* parts of the space vehicles. (RS series usually rode Piggyback on commercial COSMOS vehicles). They were dedicated linear transponders.

FM 'appeared' on LEO's with the Pacsats, UO-11, Dove, FO-12, AO-27 and UO-14 - none of which was aimed primarily at newcomers. The Pacsats were *NOT* single channel satellites.

When the launch market became constrained due to commerce - the 'Cubesat' philosophy was born and Amsat-NA together with Amsat-UK (against many of it's members) decided to persue this way forward in the guise of 'education'.

It's all about money Hans, money, money money and COTS components.

It's fine with P3D etc ... the 'trick' will be getting it aloft without tying a *LOT* of knicker elastic together to make a giant trebushay.

I think that teaching the newcomer operating proceedure on a single channel mode like FM is akin to shooting him/her in the foot - but that's Amsat-NA's policy ... and for the forseeable future, it looks like they're sticking to it.

Amsat-UK on the other hand appear to have realised that they lost too many members when they sent so much money to support AO-51 - against the members wishes.

(There was a referendum)

Possibly (!) why they're now concentrating on FunSAT, a linear satellte, but, to the best of my knowledge , with no launch opportunity secured. Ditto the ZL project.

More and more countries are jumping on the 'Space Agency' bandwaggon (read: money) but not many are showing interest in amateur radio ... except of course for their universities
to grab a couple of free bits of the RF spectrum which most government agencies are *SELLING* off for a *LOT* of money.

It will be interesting to see just how many 'space engineers' these education projects produce. Most students use the projects to get their degree then forget! it. They're not interested in radio.

Me? ... sceptic? ... GERROFF !!!!.

73 John.

73 John.

I think most people can see the result.

3494. DX News

Yahoo group: eu-amsat
Date: 2010-06-05 16:45:33 UTC
From: John Hackett
Topic: 3494 Message: 3494

Group,
Keeps your eyes and ears open looking 'south'.

73 John. <la2qaa@...>
.....

Hi John,
7Q7HLT is coming up on AO-51 from a new grid further north (KH78) in Malawi this

afternoon and I have just received an email from VQ9JC (MI62) that he will be on AO-7 on a

short pass at exactly the same time. Luckily I already worked Jim at VQ9JC last year so I will

make sure I have the new grid in the log before I look for him.

ZR6DEA has been on from Nigeria this past week and will also be going to Ethiopia in the

coming week. We have been working with Sid, ET3SID up there who is quite keen to get set up

for satellites but hasn't had much luck hearing anything to date. Hopefully Dean will be able to

help Sid find where the problem is and get him going on the satellites soon.

73 - Hal ZS6WB

3495. African DX.

From: John Hackett
Topic: 3495 Message: 3495

For the FM afficiondos,

Please note that 'looking south' may bag you a couple of new ones.

For those that wondered about the HO-68 scheduling ... please note Hal's remarks about eclipse. Camsat may ne new but they *DO* know what they're doing.

73 John. <la2qaa@...>

.....

Hi John

I was just looking a bit more at the HO-68 schedule and I see why those turn-on times were chosen. On both passes it is as the satellite comes out of eclipse.

It has been a super day for DX today. We worked 7Q7HLT on AO-51 in the new grid in Malawi and suddenly ET3SID popped up and we worked him for a new one.

VQ9JC was also in there on AO-7 and several of the guys worked him.

John, ZS6XK is now at the mid-point of his two month tour of Southern Africa and his trip has been eagerly followed by fellow radio amateurs with contacts through the amateur satellites. Since his first satellite operation on 27 April from rare KG63 while still in South Africa, John has gone on to operate from another seven grid squares. Four of these were as C91HLT from Mozambique and a further three as 7Q7HLT in Malawi. The Malawi numbers might still increase before John moves into Zambia in the coming week on the next leg of his trip.

Up to this point John has logged a total of about 100 satellite QSOs from the eight different grid squares using only the SO-50 and AO-51 satellites and among the contacts were stations in all six South African call areas plus Mozambique and Reunion Island. One of the more noteworthy contacts was with ZS10WCS, the special station for the 2010 World Cup which will be held here in South Africa during the month of June.

These contacts were made by John from bush locations using only a Yaesu FT-530 dual band handheld and an Arrow handheld dual band Yagi. Signals have been outstanding from all locations and contacts have been completed without any difficulty.

If you haven't contacted John yet as 7Q7HLT from Malawi, you only have a few days left before he moves into Zambia. This is especially true if you are collecting satellite grid squares as many of these areas have never had satellite activity in the past and they probably won't have activity again in the foreseeable future. John will be concentrating on AO-51 as the late afternoon passes are at the most convenient times for both John and the

stations he will be adding to his logbook.

Thanks to John for the fun we have had during the past month and for the interest he has generated in amateur satellites. We're waiting to see what exotic location he will pop up from next.

Hal ZS6WB

3496. DX reports.

Yahoo group: eu-amsat

From: John Hackett
Topic: 3496 Message: 3496

Group,
You may have noticed that I'm receiving regular DX reports for the FM satellites from ZS6WB. Hopefully, posting part of them here will encourage a bit of 'DX' and some 'gentlemanly' operating on that mode too ... as opposed to the 'alligator'' syndrom usually created by DX contacts.

Please !!! listen ... and give priority to the QRP, Portable and Mobile stations.

Several people successfully worked the MM DX earlier this week.

All it takes is a bit of patience and practice. Remember, satellite operating is *PRIMARILY* (but not necessarily) full duplex so there really isn't any excuse for calling on top of another station ... other than poor receiving equipment or bad manners ... the former, being the main culprit.

More and more people are becoming aware of the problem of QRM'ing eachother. Lets bring some pride! back into amateur radio. It's up to each and every one of us ... individually.

DX News.

I looked at the two HO-68 passes that we are going to miss out on and have sent information to

ET3SID on them He will see both of them and have good coverage on them. The one tonight

looks like it will give good coverage up into your area. He only managed two QSOs and will

probably need a bit more experience before he really get involved in pileups up there but I think

in time everyone in Europe will have a chance at working him both on FM and SSB.

7Q7HLT is expecting to move over to Zambia this week and ZS8M on Marion Island is waiting

for better weather before he can go outside to operate. With a bit of luck we should add a few

more grids to the collection this week.

3498. HO-68 mode survey.

Yahoo group: eu-amsat
Date: 2010-06-06 15:31:34 UTC
From: John Hackett
Topic: 3498 Message: 3498

The HO-68 mode survey from May 3. 2010 showed the following results ...

1) SSB/CW
2) PACKET
3) SSTV.

Not one single European station that replied requested FM as the priority mode.

ZS6WB was the 'ONLY' station that requested FM - this was *ONLY* for the
benefit of the new-to-satellite operator of the DXpedition in Africa.

The results will be sent to Camsat.

"As we speak" ... there is still no word as to how the schedule will be organised after
commissioning is complete.

From: LA2MOA
Topic: 3499 Message: 3499

HO-68 had a very nice pass over the Scandinavian peninsula at around 20:30 local time (18:30 UTC). Despite the ZOO (Thank God SO-50 had a pass over Europe at the same time, otherwise the situation on HO-68 most likely would be even worse), I managed to work a few Q's with my humble station setup.

The very first lucky one to work me on HO-68 was *tarrammm*, hi:

LA4FRA in JP20qi, then
ON5NY (JP10mv), UR4LRH (KN89cx) and SP5XSD (KO03sb) followed. Nice indeed. One sad thin though: At the end of the pass the HO-68 footprint covered Scandinavia, the northern parts of the British isles as well as Iceland, the whole Greenland and a VERY good part of Newfoundland, Nova Scotia and Northern Quebéc. I people *ever* could learn to listen for a few seconds between the calls - there most likely would have been one or to QSO's over the pond as well. But this is of course too much to ask for...

The booms for my X-yagis are drilled and finished. Soon I'll be on HO-68 in linear mode.

I most ceratinly agree with the rest of the EU ops. HO-68 must never carry FM/Repeater as a priority mode. Never. Ever. Listening to the FM LEO's during weekend is nothing but pure pain. Ordinary weekdays is better.

Topic: 3503 Message: 3503

Question.

Anybody else using APRS messages on HO-68 ??? ... apart from Dimitry - (UA3AVR).

>Fm UA3AVR To CQ Via BJ1SA <UI pid=F0 Len=53 >[19:21:35]

>=5545.33N/03745.38Ey, de UA3AVR, loc KO85VS {UISS52}

>

>Fm BJ1SA-12 To BBSTAT <UI pid=F0 Len=16 >[19:22:07]

>Open BJ1SA-12:0

>

>Fm BJ1SA-12 To BBSTAT <UI pid=F0 Len=16 >[19:22:43]

>Open BJ1SA-12:0

73 John. <la2qaa@...>

PS.

Calling the FM operating on satellites a zoo s *WRONG* !!! ... and it's an unfair insult to the animals, most of whom show far better behaviour ... caged or not.

I monitored the HO-68 orbit 2285 (according to Nova) and could hardly believe that satellite operating was (essentially) full duplex operating.

What I have trouble understanding is that If stations can actually hear someone already in QSO surely! they must realise that it's rather pointless to call 'CQ satellite' on top of
the stations in QSO ... but this occured over and over again as HO-68 progressed along it's orbit this evening.

Maybe I don''t understand because because I only have two functioning braincells left ... and one of those is on it's last legs.

There were! a couple of exceptions with very good operating proceedure but I won't mention their callsigns - they know who they are - since it's not my intention to either 'hang out' or
give credit to any particular station.

It has convinced me though that Packet is the only viable option for me when HO-68 is in FM mode.

73 John. <la2qaa@amsat.org>

3504. Sorry for multiple posts (and a little one about APRS)

Hello John

As you knows, Packet and SSTV are "sub modes" of FM voice. There is
always a possibility to cry "oooohla" or whatever between Packet
or SSTV transmissions. How do you handle this without discipline from
many OP's ?

Hello Thomas,
Regarding the 'zoo' operating ...

>How do you handle this without discipline from many OP's ?

Well, I appeal to common sense, good manners and good operating proceedure.

I'm *HOPING* that when HO-68 is in SSTV mode most Hams will refrain from transmitting pregnant cow noises and HOPE they'll understand that QRM ruins a transmitted picture.

As I mentioned previously - 99.9% of Hams *KNOW* you shouldn't transmit on top of somebody else deliberately - but they still do it. I think it's mainly impatience, again, brought
on by poor operating proceedure.

With contest style proceedure (satellite FM) one should operate as if one was in a contest. For instance, there's little point in saying the contact's call 3 times (!) he knows his own call very well !!! - it only needs to be said once - so that we all know to whom a particular station
is referring ... and then it eith QSL - or please repeat your call/locator.

We *DON'T* !!! need to know what colour his socks are nor what he had for breakfast last Tuesday morning.

The *INTERNATIONAL PHONETIC ALPHABET* should be used. 'Willy', 'Sparrow' and 'Luther' only cause confusion and waste time.

A good tip would be to download a couple of AO-51 recording from over the USA. They'll illustrate how it *SHOULD* be done ... with the odd exception due to inexperience.

Teach by example.

Listen and learn.

Be aware, you'll *ALWAYS* get one clown. Ignore them and they *WILL* go away.

'Police' them and they'll acheave what they set out to do ... QRM you.

Topic: 3507 Message: 3507

Hello Hal,
My intention has never been to promote 'non-FM'. I was referring to the
PRIMARY mode of operation over Europe.

Perhaps I could have expressed myself a little better. Put it down to being a Brit but thinking like a Norwegian ... whether that's an advantage or a disadvantage is debatable. Perhaps my two remaining brain cells are becoming exhausted.

Like Africa, The United States operators seem to prefer FM as the PRIMARY mode on HO-68.

I *HAVE* made Camsat aware of the different continental preferences.

I understand and am aware of the different criteria for Africa and rest assured Hal, I
HAVE
made ALAN kUNG aware of these preferences.

If and how they will affect the schedule in the near future, I can't say.

> >

If you define "unproto APRS via BJ2SA" instead "unproto CQ ..." then
every OP who connected his APRS-software to a APRS-server will forward
your location to the internet. This example shows that the digipeater
is switched on ("D:1").

> [snip]
>
> It has convinced me though that Packet is the only viable option for

I fully agree. SSTV only works by full discipline. I suggest to create
timeslots for declared users who transmits their picture.

Group,
Here's an excerpt from a mail from ZS6WB.

Comments are invited.

73 John. <la2qaa@...>
.....

SNIP ...

..... whatever they
decide on, HO-68 is still a great satellite.

Perhaps you
could appeal to the FM crowd not to call a station on HO-68 unless he is

3500 km or more away. In other words, if you can work a station on AO-51
he
should be off-limits on HO-68. Maybe you could start a listing on the
HO-68
blog of the longest distance contacts made on FM and SSB/CW. Perhaps
this
motivate the FM operators to do a bit of self policing and operating
techniques
and manners might improve as a result. It might be grasping at straws
but
there must be a solution.

Good suggestion Thomas,
I know Mike DK4WN is interested in satellite SSTV too.

As you'll have noticed, we're trying to find subtle ways to utilise the satellite effectively.

Obviously!, we're not going to please everybody! all the time but hopefully 'everybody' *WILL* realise that we're doing the best we can.

While Europe and Japan voted for a primary mode of CW/SSB for HO-68 it should be remembered that Africa, (probably) South America, Australia, The United States, India and the Middle East prefer FM.

Sometimes due to the equipment available, sometimes due to ease of operating while mobile and portable.

Also, as I mentioned previously, for the time being, the satellite passes are being coordinated
as the bird comes out of eclipse ... for obvious reasons - (commissioning and testing).

We should all do our part to increase the awareness for good operating proceedure.

Lead by example.

Sometimes emails can take an age to reach their destination. Last Saturday morning someone sent me an email but it didn't arrive in my Inbox until Monday evening.

Email delivery isn't always reliable.

In general, e-mails either get from A-B eventually or are deemed undeliverable. Sometimes as Trevor points out, they can be delayed, at times for technical reasons. I've seen this first-hand at work because I can monitor our network provider (JANET).

In the case of a forwarding delay, the mail server should indicate to the sender (after a pre-determined period) that the message has been 'delayed'. The mail server will try again to forward the message in the time slot it's scheduler is set for, but if the message really cannot be forwarded, the sender will be informed that the message is 'undeliverable' and the message will NOT be forwarded.

The point I'm trying to make is that email systems in common use always inform the sender if a message cannot be delivered. It's generally safe to assume that if you send an email and you don't get a message saying that the email has been delayed or is udeliverable, that the message has indeed reached it's destination.

In short, email *is* a reliable means of communication because you do get excellent feedback from the mail servers. If an e-mail is delayed or can't be delivered, *you* should be the first to know.

Consider this. Why is e-mail so popular? I know why I prefer it to the Royal Mail, and it's not all to do with cost or convenience. It has a great deal to do with automated feedback, on the very rare occasion that a message doesn't reach it's destination, or is delayed.

Unfortunately there's not always feedback, in the case I mentioned there was none at all to indicate the message was delayed 3 days.

Our expectation may be one of near instant delivery for emails but the reality can be different.

The micro-propulsion system being developed for Deli-n3Xt CubeSat looks good.

http://www.southgatearc.org/news/june2010/cubesat_shop.htm

I presume at this stage it's only for very limited orbit changes but could show the way towards getting higher orbits on future satellites.

The Solar panels on the 3U CubeSat will deliver an impressive amount of DC power - 10 Watts - not bad for something that size.

Hi group, and Trevor.

All of the mainstream mail systems I know of produce automated feedback messages for users, so for anyone who is unhappy with a webmail service, say so!.. not to me, but to the webmail sysop.

Having said that, I've personally never sent an email that I didn't have some sort of reply to, whether by the recipient or by the mail server. I use email a great deal, and have never had any issues with it. For anyone who does, you should complain to the sysop of the mail system in question. If only smailmail were half as reliable as email!

3523. ... and yes, it *IS* radio.

Yahoo group: eu-amsat
Date: 2010-06-13 18:07:43 UTC
From: John Hackett
Topic: 3523 Message: 3523

Hello Al,
So who needs to carry a rig?.

As well as SATme, I have RDM (Remote Desktop Mobile) on my mobile mobile.

I can operate satellites while sitting on the Throne - (toilet, to you!) - thanks to a program called 'Wake Up On Standby'.

I can put the laptop on standby and take the bus to town.

In town I can wake up the computer at home (using the phone - and RDM) then start UISS to send packets with WISP. Since that's transmitted as RF from the FT-290 it *IS* 'radio' ... even though there's a computer - (and a mobile phone) - involved.

WISP *knows* when HO-68 is in view so sends and receives messages automatically.

Yessssssssssssss ... I agree with you ... so what !!!!.

Just an interesting form of 'operating satellites' remotely.

73 John.

CC'd to the group for general interest.

3524. Is the novelty wearing off? ...

Yahoo group: eu-amsat
Date: 2010-06-13 18:39:15 UTC
From: John Hackett
Topic: 3524 Message: 3524

This evening was the first time in 6 months that I havn't managed to work anyone on CW while HO-68 was in linear mode.

I wonder ... is the novelty wearing off?.

Dom has previously noted the poor pass schedule for southern Europe - for me in northern Europe the pass this evening (orbit 2376 in NOVA) was again excellent! - with a footprint from Portugal to Pakistan, west to east and Svalbard to Sudan, north to south ... almost 50 countries.

I just wish there were some CW operators in the less 'amateur' populated countries like the Middle East and the Northern African countries.

Indeed and we need many more amateurs in those areas whether they no cW or not, since each country has a vote at ITU.

Since the removal of the morse test in the UK in 2003 very few new people have learnt it and long-term I think the mode is into terminal decline.

The decline is unfortunate as so far nothing matches CW for low power satellite working. There doesn't yet appear to be a narrow-bandwidth digital mode that equals it.

73 Trevor M5AKA

3526. Wise words indeed.

>The decline is unfortunate as so far nothing matches CW for low power satellite working. >There doesn't yet appear to be a narrow-bandwidth digital mode that equals it.

>73 Trevor M5AKA

Wise words indeed. As an ex: Signals CW instructor (RSARS 1654) I can only agree with the second sentence.

PSK31 is a weak signal mode but as it's 'father' Peter G3PLX admits, it isn't suited to satellite
operating - though it is possible, as attested to by PE3PCH and myself over AO-7 ... and then only due to absolute minimal doppler. PSK31 can't be 'read' by ear either.

We can only hope that future Hams will realise the significance, and learn the code, if only
for the sake of communicating as an 'art' - lets face it, anybody! can waffle into a microphone ... *BUT* ... I fear Trevor, you may very well be right - in that it's in terminal (pardon the pun) decline.

NB.

(terminal as in ... 'repent! ye, for the end is nigh').

I for one will keep at it until I croak ... and who knows ... maybe somebody will hear the tapping on the inside of the coffin lid.

Hello John and Luc

Sorry about this off topic theme, but I have crawly fingers. :-)

If anybody has a long "meeting" in the toilet we are asking "Are you sitting on the Throne ?"

As you can see, this theme is international. :-)

Hello Thomas, Luc,
No apology necessary for 'off topic' comments Thomas.

Anything (within the bounds of reason) that any member of our group has to say is of interest to me.

Very interesting to note that the 'Throne' is international - I didn't know that.

Thanks for the heads up.

Luc,
personally, I'm very glad that Canada is - 'on our side' - much more so than that 'other' lot further south ... he he he.

Have a good day, both.

73 John.

3530. Surprised.

Yahoo group: eu-amsat
Date: 2010-06-15 18:23:21 UTC
From: John Hackett
Topic: 3530 Message: 3530

I must admit - I'm surprised.

Orbit 2402 of HO-68 this evening ... one single Italian station calling CQ (on top of me) and
not getting any reply - (but kept calling CQ on top of me anyway!) - which I found rather amusing (I've been at this game quite a long time) considering he hasd the entire passband to himseld except for the few couple of hertz (sorry! GM1SXX, I meant 'Hercles') I was using.

My point? ... where did all the linear satellite operators go?.

Speculation, but could it be that they just got sick of the FM zoo and threw in the towel?.

In the days of RS-10 to 13, FO-20 etc ... the LEO's were literally 'TEEMING** with activity.

Now, Such a great satellite like HO-68 in linear mode and 2 stations on the pass.

Of course, it's possible that there was someone on the other end of the passband because I was only listening to my own downlink (plus the 'friendly' Italian on top of me) but there's no doubt the pass would be classified as under utilised.

A pity, after all the effort the Chinese put in to provide this easy to use satellite.

Perhaps others have a different opinion ??.

73 John. <la2qaa@...)

NB.

'Hercles' - because GM1SXX and myself have been informed by the amateur examining board that 'cycles per second' is *NOT* the correct answer as to how 'frequency' is measured. The *CORRECT* answer is Hertz ... however, since all textbooks and most radios were marked in CYCLES PER SECOND I coined the word 'hercles' ... a hybrid hertz and cycles ... to keep the tick-box folks happy.

One student (now a licensed amateur) answered 'cycles per second' ... and was marked *WRONG*.

Is *this* why amateur radio is going down the tube?,

Together with the atrocious operating proceedure deemed 'acceptable' ... (OK, that last bit was just my own personal opinion).

When the 'teachers' are incompetant - you can't really expect a high standard.

I just wonder if the 'empty' transponder (third consequative day) was due to the linear operators jumping ship.

73 John. <la2qaa@amsat.org>

3531. (no subject)

Yahoo group: eu-amsat

From: John Hackett
Topic: 3531 Message: 3531

I apologise before the fact ... more whinging ...

This pass of HO-68 (2403) showed a bit more promise - with a footprint down to central Africa from my QTH but this time on my 5th CQ (on a clear frequency) a Polish station decided that this was the best place for him to call CQ too ... on SSB.

I'm still debating (with myself) as to whether this is due to ignorance, bloody-mindedness for a weaker station, a lack of understanding of full duplex or just not bothering to listen before starting to call. There's also the possibility of the sliding down in frequency 'out of sync' being due to the different tuning conventions ... as well as CW and SSB *NOT* being on exactly the same tuning rate - (all things being equal).

Try as I might, I had to tell the station that did his best to answer me I just couldn't copy his call through the Polish QRM ... yes, I did! QSY (even though I was there first) but the Pole just slid right down on top of me again.

I guessed wrong !!! ... I should have QSY'd up - but the last time I did that I 'caught' another bstation coming down! ... ahh, the joys of satellite operating when people can't asgree to use the same tuning convention.

I could copy my own downlink (on a clear frequency) at S6 so there really wasn't any excuse except possibly a half duplex station, for the QRM ... in which case that station ought to listen
a couple of KC's either side of his calculated downlink.

Whatever happened to QRL? ... I could have answered on SSB ... not that it helps much with the - "Mine's bigger than yours!" - attitude. I recall on RS-10 and AO-13 people always! asked
if the frequency was in use before blatting out a string of CQ's.

Like Robert Zimmerman (Bob Dylan, to you) said ... "The Time's They Are A-Changing". He ought to have added ... "ans so are the operating habits".

73 John. <la2qaa@...> ... aka ... SOF ... (sour old fart).

Hi John,

The world has changed in the past 20 years.

In 1990 all new Amateurs started off on the VHF/UHF bands and a significant proportion used SSB.

For the last 8 years new Amateurs have started on the HF bands first and if they do eventually get any VHF/UHF equipment it'll be an FM rig connected to a simple omni-directional antenna.

There are a rapidly diminishing number of Amateurs left who still use SSB or CW on 2m or 70cm and it's those people that have traditionally provided the satellite operators.

The 2m and 70cm CW/SSB segments these days are empty most of the time.

Don't know what the solution is.

73 Trevor M5AKA

3533. A logical explanation.

Yahoo group: eu-amsat
Date: 2010-06-16 08:50:08 UTC
From: John Hackett
Topic: 3530 Message: 3533

Hello Trevor,
Yes, I think you're right. That seems to be a logical explanation ... plus the fact that a lot of the RS-10 operators who were 'grown ups' at the time have now QSY'd to that great shack in the sky ... or in LA2qaa' case - are destined for that other 'southerly' place.

Hey! ... look on the bright side ... after having lived here for 32 years it will be a change to
be 'warm'.

Seriously, If I'm to continue to faff about with set-alights (satellites) I might soon have to bite the bullet and use FM ... arrrrrrrrrrrrrrggh !!!.

I *HAVE* been warned that emulating the Americans and using 5 watts to an Arrow is dead in the water these days (in Europe) - with 2 x notable exceptions, 1 x Yorkshireman and 1 x Norwegian !!! - (not me) - for the rest, it sounds like a fox in a hen coup.

I have been using 2 watts (CW) to an Arrow (portable) with a fairly decent downlink on HO-68 but continually get *STOMPED* on - I suspect by 'alligators' who don't listen before expelling the 'breathy' CQ's in haste - lest somebody might actually answer.

I envy my mate ZS6WB who has worked ET3SID, 9J2HL, Z21HLT, ZD8DC and a whole bunch of other DX this last couple of weeks on the various satellites.

I think the standard of operating is vastly different in South Africa where they don't have 50+ countries in the footprint. Appealing to common sense and good manners in Europe appears to be a *TOTAL* waste of time.

Maybe I'll have to crawl back to AO-7 with my tail between my legs. At leat there, the operating is not 'quite' as bad - due to, I suspect, mostly (but not all) experienced operators
and permanent linear modes of operation.

Ah interesting. I knows there was anything with Cycles but don't know
the story behind it. It would be interesting to know why the dials was
marked with Cycles. Was it a political reason against a German physicist ?

Privet Igor,
Now that's !!!! a good one - you had me 'wetting' myself with laughing ...

It cetainly beats my 'Hercles' ...

1000 very heavy motorcycles ... per second!.

Brilliant !!! ... he he he

I wish everything was as sensible as Russian.

'Y John' ... instead of ... 'My name is John'.

73 John. <la2qaa@...>

Hello group!

--

Hertz-

Abbr. Hz

A unit of frequency equal to one cycle per second.

(The American Heritage® Dictionary of the English Language, Fourth Edition copyright ©2000 by Houghton Mifflin Company. Updated in 2009. Published by Houghton Mifflin Company.)

--

1 kilocycle per second - one thousand periods per second.

(Based on WordNet 3.0, Farlex clipart collection. © 2003-2008 Princeton University, Farlex Inc.)

--

It's not "one thousand very heavy motorcycles" how I think at first time :)

3539. Re: Cycles and Hertz

Yahoo group: eu-amsat
Date: 2010-06-16 14:34:44 UTC
From: Al
Topic: 3530 Message: 3539

Hi group,

All this stuff about Hertz and Cycles per second originated with me.
I'm an instructor for the UK amateur radio examinations and I had to mark a student wrong last year for choosing Cycles per Second rather than Hertz because the RCF (Radio Communications Foundation) deem it to be the 'wrong' answer, despite the term still being in widespread use in the 'real' world. The same pair of questions appeared in a recent exam I marked. Fortunately the student was astute enough to choose the book answer.

CP/s didn't simply disappear with the change in teaching some decades ago to SI units! When I complained about the content of the question, Alan Betts G0HIQ of the RSGB (and probably also the RCF), and author of several of the officially approved training books, assured me in no uncertain terms by email that 'cycles per second' is *not* a measurement of frequency. I beg to differ, as do Wikipedia and many other information sources. I did send him the various references, but got no reply. I wonder why?
Most of my radio dials (they are fairly old) will now have to be altered from Mc/s to Megahertz and from Cp/s to Hertz, to comply ;-)

There are many other glaring anomalies in the teaching material but this is not the correct forum for them. I'm already O/T enough :-)
Suffice to say that I now inform students that despite official advice to the contrary, there *are* questions designed to trick them in the exams, that they should read everything *very* carefully, several times, and that only the 'book answer' will suffice. It seems to be paying off. In short, if you have a technical background... you could be in big trouble!

Absolutely agree. The definition of Hz is "number
of cycles per second". From the Encyclopædia Britannica, just to cite one :

Hertz
unit of frequency. The number of hertz
(abbreviated Hz) equals the number of cycles per
second. The frequency of any phenomenon with
regular periodic variations can be expressed in
hertz, but the term is used most frequently in
connection with alternating
<http://www.britannica.com/EBchecked/topic/182467/electric-current>electric
currents, electromagnetic waves (light, radar,
etc.), and sound. It is part of the
<http://www.britannica.com/EBchecked/topic/291305/International-System-of-Units>International
System of Units (SI), which is based on the
<http://www.britannica.com/EBchecked/topic/378783/metric-system>metric
system. The term hertz was proposed in the early
1920s by German scientists to honour the
19th-century German physicist
<http://www.britannica.com/EBchecked/topic/263899/Heinrich-Hertz>Heinrich
Hertz. The unit was adopted in October 1933 by a
committee of the International Electrotechnical
Commission and is in widespread use today,
although it has not entirely replaced the expression □cycles per second.□

To me this is a non-problem.

Hi Marco and the group.

In the 'real' world, the terms Hertz and Cycles per Second are generally interchangeable , because they share the same meaning, but to the RSGB and RCF (who set exams in the UK), they appear NOT to be. Foundation exam candidates in the UK may fail their exam because of the distinction between what is taught, and what simply is. For anyone who thinks there is a case to answer, I suggest you contact the RCF or RSGB with your concerns. They certainly don't listen to me. I checked many sources *before* I complained to the RCF. All of them said that Hz = cycles per second, but I still have to mark as incorrect, any papers where the candidate chooses cycles per second! All of this arises because the RCF Foundation syllabus teaches that 'the unit of frequency measurement is hertz'.
It is not fair (IMO) to mark a candidate wrong for using a non RCF approved unit of measurement, especially when TWO generally accepted units of measurement are included in the answer set! .

From: Thomas Frey
Topic: 3530 Message: 3542

Hello Al and Marco

My meaning is that "cycles per second" does not describe what is cycling.
If you say "electromagnetic cycles/s" then it is correct and means Hertz.
If you say Hertz, everyone knows what you mean.

But my previous question was about the history of "C/s" or "Cps". John
wrote that dials are marked with Cycles/s in the 1940s to 1960s. In this
period was the WW2 and the cold war. My guess is that this marking had
a political reason against a German physicist (Heinrich Hertz).

Am I completely wrong or what do you think ? Or do you know the reason ?

Just have a look at PE1RAH William Leijenaar web page http://www.qsl.net/pe1rah/

and look at his nano sat transponder satellite

http://www.qsl.net/pe1rah/mysat2.htm

Technology is there but is the AMSAT-NA mentality will change? I wrote in the past at numerous time that it's will be through an

international effort amateur radio satellite launch will succeed. It's already done! Look at all the cubes sat launch in the past 5 years
nothing came from an AMSAT-NA project.. here is the international effort i refer too.

Yes AMSAT-NA is having projects but AMSAT-INDIA gets help from William PE1RAH for his VO-52 transponder. Just for the record AMSAT-DL is
still working on an HEO P3E. There will be no salute if AMSAT-NA persist to fold on themselves trying to make his own 50 states affair as
if they are too ashamed to work and i mean really work on an international cooperation base.

We are in 2010 and i don't know if the AMSAT-NA BOD is aware that we are in a globalized world? Your telephone call center is in India and
your cars are manufactured in Mexixo. Having the very same people always playing the musical chair in the AMSAT-NA BOD will only lead to
the same old paradigm who is by definition :a philosophical and theoretical framework of a scientific school or discipline within which
theories, laws, and generalizations and the experiments performed in support of them are formulated; broadly a philosophical or theoretical
framework of any kind. Is it not a characterization of the past 7 years of AMSAT-NA actions? I think yes and it's lead to nothing.

Will this FOX project succeed as the many past one we can only hope but IMHO we are still in the same bad tracks even if the folks involved
are the most dedicated ones. ARISSAT-1 is probably the best tangible assets actually but how can we really think AMSAT-NA is only promoting
his new projects on paper when peoples are actually reading stuff on their I Pod and I Pad? Is this will help them attracting new blood in
the amateur radio satellite field?

If the new AMSAT-NA BOD candidates are asking for inputs it's probably because they cannot provided any new ideas only refurbishing ideas
from the past over and over again.

For those who are not accepting criticism even the constructive ones just have the BOD implementing ways and means to work on an
international satellite project will be a step in the right direction.

It's my opinion and i know you shared it...

I think you are completely wrong. I can assure readers that the terms Kilocycles and Megacycles in radio communications go back a very long way in the UK, to before the Cold war and to the earliest days of radio here. Hertz as an accepted unit of frequency measurement wasn't around until 1930. With older equipment, it seems to be a British, and an American, tradition to use Cp/s in preference to Hertz. Hertz only really started come into more general use in the UK in the late 1970's with the general change (driven by the IEC) from Imperial to SI units. I absolutely don't believe that anyone was 'having a go' at Heinrich Hertz! Check out any of the common references, or any website with old British and American military radios and you will see where I am coming from.

Wikipedia was my friend here...
(Quote)
History
The hertz is named after the German physicist Heinrich Hertz, who made important scientific contributions to electromagnetism. The name was established by the International Electrotechnical Commission (IEC) in 1930.[5] It was adopted by the General Conference on Weights and Measures (CGPM) (Conférence générale des poids et mesures) in 1960, replacing the previous name for the unit, cycles per second (cps), along with its related multiples, primarily kilocycles per second (kc/s) and megacycles per second (Mc/s), and occasionally kilomegacycles per second (kMc/s). The term cycles per second was largely replaced by hertz by the 1970s (Unquote)

Note please the last sentence, but of course unless the 'old school' hurry up and die off, Cycles per Second will also be with us for quite a while yet ;-)

At school, in the 70's, I was taught about cycles per second, not Hertz, and the term Hertz and Mhz only very slowly replaced cycles per second as manufacturers of equipment changed their markings on equipment. With the influx of Japanese built equipment, the term Hertz came into more common use among radio amateurs in the UK, but in general, most people still talked about 'qsy'ing up 25 Kcs or down 25 Kcs rather than 25 Kilohertz, and many in the UK, myself and most of the UK people I meet on the air, still use this terminology, rather than saying Kilohertz.

It's interesting that in most ways,the US has doggedly retained the Imperial over the SI system of units. Even the US Space Shuttle is imperial....all measurements are in inches. I'm informed that the only metric thing America favours in the 9mm, and I guess that's probably true ;-)

73 Al.
GM1SXX
PS I've been to the US and I have relatives and friends there... lest anyone mistakenly thinks I'm 'having a go' at the Americans.

3547. AMSAT-UK Colloquium 2010 - Final call for Speakers

Yahoo group: eu-amsat
Date: 2010-06-17 08:30:00 UTC
From: g4dpz
Topic: 3547 Message: 3547

Hi All,

This is the final call for speakers for the AMSAT-UK Colloquium 2010
which will be held at the Holiday Inn, Guildford, UK
(same venue as in 2009) on *Sat 31st Jul and Sun 1st Aug 2010*, with a beginners session on the afternoon of Friday 30th.

AMSAT-UK invite speakers, about amateur radio, space and associated
activities to this event, details of which, can be found at:

http://www.uk.amsat.org/content/view/32/42/

As this is a late call, the submission of a paper is not required but any PowerPoint or similar material can be made available online, afterterwards.

Submissions should be sent *ONLY* to G4DPZ, via the following routes:

e-mail: david.johnson AT blackpepper.co.uk

SnailMail: QTHR from www.QRZ.com

Likewise if anyone knows of a good speaker, please
send contact and other information to G4DPZ.

73

Dave
G4DPZ

3550. My portable yagi revised...

Yahoo group: eu-amsat
Date: 2010-06-18 11:28:37 UTC
From: LA2MOA
Topic: 3550 Message: 3550

Group,

For a while, I've been using a "Arrow-style" portable yagi, which basically is made of 2 DK7ZB 50 ohm lightweight yagis. 5 elements on 145 MHz, and 9 elements on 435 MHz. Elements attached on a simple boom made of a PVC tube. This has been working fine, on both FM and the linear transponder on VO-52. The last weekend I decided to revise the construction a bit. I wanted to make the antenna sturdier and not so "delicate". I have uploaded some pictures of the result, and you find them in the album named "Portable DK7ZB type II".

All material for the antenna, except the welding rods for the elements, is bought at "Biltema", a well known company here in Scandinavia, selling spare parts for cars (and almost anything else). The welding rods, by the way, is bought at "TESS" - also a well known company here in LA-land, hi!

To "stiff up" the boom and make it sturdier, I forced in a wooden broomstick into it. This doesn't make the boom much heavier, and it also eliminate the need for any strings to make the antenna go less "bananas" due to the weight of the elements. Besides, this also makes it easier to choose between horisontal/vertical polarisation when needed. The element positions are of course marked on the boom.

The boom clamps are nylon clamps, used on boats (mainly sailing yachts) to fixate just about anything that "dances around" when one's out on the big oceans. These clamps comes in many sizes, and I opted for the 30mm clamp, which goes perfectly with the 32mm PVC-boom. The elements are fixed to the clamps, simply by using shrinking hose (2-3 layers of hose for each element works fine). These clams are very versatile, and I also made a "Welcro-clamp" (welcro is heated on the clamp with shrinking hose). The welcro clamp is used to attach my VX7R on the boom.

All in all the antenna now is very sturdy. The only small problem is the elements sometimes are windmilling. However, if the antenna isn't operated with "brute force" the windmilling is minimal. Besides that, this is a PORTABLE antenna. It's supposed to be quickly assembled and quickly put back in the carrying bag.

The antenna is easily built in one or two evenings. The only thing that really takes time is cutting the elements and heating them on to the boomclamps with shrinking hose and a hot air blower.

On the air tests shows excellent results on AO-51. Next week I will try a few passes on VO-52 and AO-7 using my 2 x FT-817.

Have fun building!

Hans / LA2MOA

I had an excellent QSO with Walt ON5NY on HO-68 orbit 2441.

Thanks Walt.

The good news is that more and more operators are discovering you can get a *LOT* further with a *LOT* less power using CW ... and that you can have several people operating on the satellite at the same time.

With the small satellites of the future, reducing power will become increasingly important.

Is it not more sensible to have 10 x CW/SSB QSO's spread out over the transponder instead of just one single FM one ??.

On the Amsat-BB there have been complaints that the linear satellites are underused ... particularly FO-29. I don't know whether this is due to the no-code issue ... probably so.

Most of my generation have alreadt QSY'd to that great shack in the sky.

Hopefully, more and more of the newcomers will realise the advantages of the linear modes.

Elements attached on a simple boom made of a PVC tube. This has been working fine, on both FM and the linear transponder on VO-52. The last weekend I decided to revise the construction a bit. I wanted to make the antenna sturdier and not so "delicate". I have uploaded some pictures of the result, and you find them in the album named "Portable DK7ZB type II".

Hi Hans. Another possibility is to dispense with the plastic boom completely and use a wooden broom-handle for the boom. Cheape and easily obtained at most hardware shops. For outdoor use, this should be protected from the WX by applying at least three thin coats of yacht varnish. Broom handles are strong and dependable and unlike plastic don't sag. I learned this trick a long time ago from LA2QAA via Oscar News magazine. I normally use hollow aluminium elements, but whatever you have that is conductive will do. I sometimers use copper microbore pipe instead.
Happy antenna building.

Hi Al!

Yes, you're completely right about dispensing the PVC-tube completely. The thing is, that I already had the PVC-tube and the clamps, so instead of buying a set of 19 new claps in "broom-stick size" plus a broom-stick, I just bought the broom-stick, hi!

Regarding wooden booms, just wait until I'm finished with my crossyagis for 145 and 435. These are built in "Norwegian wood-style"... 6 x 6 elements on 145, and 10 x 10 elements on 435. Both antennas RHCP and built on 1" x 1" inch booms of the finest Norwegian pine. By the way, I'm using 4 layers of varnish on my booms, hi!

Hi Hans,
Being Scottish, I have a great aversion to spending money on 'aerials' as they are known in the UK. Almost all of my aerials are DIY jobs made from scrap materials and work very well for me. Only fairly recently I obtained a second-hand MFJ-259B antenna analyser, which I'm glad to say tells me that I correctly guessed my element sizes and spacings well in the majority of my aerials. At our local radio club, I now have a number of people building their own aerials with a good success rate. I had never heard of 'wooden aerials' until I came across 'Observations from Norway' by LA2QAA, which changed my way of thinking about aerials in particular!. I've also built a few of Jerry Brown K5OE's designs, with timber rather than plastic tube, and I've met Jerry in person. I have a wooden version of his 70Cms Quagi in my attic ...no varnish at all, just bare timber I salvaged from a skip! Have fun with your DIY aerials. Building aerials can be very educational. I have one commercially made aerial, a 'white stick' colinear. I bought that one to replace a DIY version that looked like a large white banana, having been bent by repeated gales. It still worked 100% but looked bad! Unfortunately I could not find a local supplier of sturdy fibreglass tube, so I was forced to *buy* a replacement. It hurt for a long time.. spending money on aerials!

GM1SXX Said:

"It's interesting that in most ways,the US has doggedly retained the Imperial over the SI system of units. Even the US Space Shuttle is imperial....all measurements are in inches. I'm informed that the only metric thing America favours in the 9mm, and I guess that's probably true ;-)"

This is an incorrect statement.

Since it operates in a world market, America's industry and business has converted to metric for quite some time.

It's the public area where there is a failure to change. For example, the local market sells soft drink by one liter bottles, but milk still comes in one gallon bottles. Highway distance is still miles. I tried to purchase an 8mm drill bit at a local big box store. They only stocked imperial sizes. I had to purchase it on EBay.

Sometimes I think that the USA should switch over just like it did for digital TV. But think of the effort required to change all the signs in a country of 300 million people with a vast highway system. It would probably be undertaken one state at a time.

It's certainly much easier to home brew antennas using metric.

One thing is certain, my imperial socket set works on absolutly nothing any more. I have to use my metric sockets with (of course) a 1/4 inch driver to work on about everything.

With all the problems we got going here, this conversion is way down the list.

I would like to see it happen.

Regards

Mike (K9QHO)

Well Mike, you do make a very valid point there. My understanding is that in the US, like here, new products, and of course especially imports from 'metric' countries like China and Japan *are* forcing change, but change at home, in industry, from Imperial to metric, takes time... and a lot of money. Imported consumer goods undoubtedly drive change faster than other areas which can be burdened by often costly legacy equipment. I work in in a college in IT support, and in our engineering department, imperial sized things still abound, simply because of the cost incurred in going metric. We still have plenty of imperial sized nuts and bolts and machinery etc, alongside the metric ones. In my own business (IT), everything went metric a long time ago. It had to.

I'm a keen watcher of all things space-related, and one thing that interested me was is that the NASA ARES demonstration launch was really only possible because legacy shuttle parts(imperial not metric) were available to do it with. Sure, they had to manufacture some new stuff, but it was essentially shuttle derived hardware in most part, and therefore imperial, and not a slave to the SI system of units.... but this is getting way off topic now.

DX NEWS.

NB.

Please remember, The EU Amsat group has members on all continents except South America,

so if a particular station is not in *YOUR* footprint, don't whinge, he'll be in somebody else's.

Tomorrow (22 June) will be the last day of operation for ZD8DC - but he may be back on

Ascension later in the year.

ZS6KX is now in Zimbabwe operating as Z21HLT but is limited to FM only so will be out of

range of Europe. ZR6DEA is planning a trip to Botswana this week but it's not known how far

north he is going and whether he will work FO-29 and AO-7 on this trip.

Sid ET3SID was heard calling on AO-7 this morning.

Reported by Hal ZS6WB.

3562. Balloon mission done by Austrian hams

Yahoo group: eu-amsat
Date: 2010-06-22 11:15:46 UTC
From: William L
Topic: 3562 Message: 3562

Hi AMSATs,

Last weekend there was a balloon mission done by Austrian hams.
It did have a linear transponder onboard, which is very known to me ;-)

More details can be found on their website:
http://www.oevsv.at/opencms/modules/news/20100621_ballon_passepartout_5_nachlese_2010_graz.html?uri=/index.html

For the hams who missed this mission... next weekend at the ham radio 2010 event in Friedrichshafen there will be another balloon mission.

Date: 2010-06-24 09:05:45 UTC
From: m5aka
Topic: 3565 Message: 3565

The IARU International Amateur Radio Satellite Forum will this year be held in conjunction with the AMSAT-UK Colloquium which takes place in Guildford, England on the weekend of July 31 - Aug 1.

The forum, chaired by IARU Amateur Satellite Advisor Hans van de Groenendaal ZS6AKV, takes place on the Sunday morning.

On the Agenda is a report back on the activities of the IARU Satellite Adviser and his Advisory Panel.

There will be a brief presentation covering the ITU notification requirements for satellites operating in the amateur service and the requirement to be able disable transmissions should the signals interfere with other users of the radio spectrum.

The forum is open to all delegates at the colloquium.

Colloquium Info: http://www.uk.amsat.org/colloquium/

From: LA2MOA
Topic: 3570 Message: 3570

Group,

Despite (deliberate??) QRM and CQ-calling from FÃ□F**, I and Nick KB1RVT in FN34 managed to complete a FM QSO-today at 12:49 UTC. QSO has been confirmed by Nick KB1RVT.

Distance between JP50HW & FN34JK is 5506.18 km (3421.539 miles)

Rig on this end was a FT-817 @ 5W into a turnstile for the 2m uplink and the old trusty FT-470 into another turnstile for the 70cm downlink.

Tuesday this week my antennas for SSB/CW will be up and running. Then I'll be QRV on the linear transponders as well.

Life's too short for QRP? Nope, instead the world is much too small for QRO!

3572. Excellent signals.

Yahoo group: eu-amsat
Date: 2010-06-29 18:05:19 UTC
From: John Hackett
Topic: 3572 Message: 3572

To whom it may concern,
An excellent pass over Europe on HO-68 just now at 290620101722Z.

Excellent downlink signals but no stations in the passband . (unless there was someone at the other end while I was calling CQ).

I'mk beginning to wonder if all the 'linear'' operators have QSY'd to that great QTH in the sky -
or if they've simply thrown in the towel ... and like me, find "599 in JP33WB" - on FM a complete and utter waste of a resource.

Of course, there may be those that find the FM zoo interesting, ie, the 'contest' orientated Ham.

Personally, I find it totally boring - but each to his own.

I just think it's a bit strange since not one single European operator requested FM as the primary mode when I asked for input several weeks ago - yet the 'linear' passband was silent just now.

I fear 'the zoo' style of operating has completely taken over the amateur satellite scene - just like Commander John Brannegan G4IHJ (SK) predicted it would.

The space (as in 'area') required for 'linear' transponders is no longer an excuse - see PE1RAH's
Pico-Ponder ... you can stuff a dozen or so of those in a cubesat - (OK! ... 11).

If FM is *THE* mode of the future a lot of people need to read up on operating proceedure and
the meaning of full duplex.

In South Africa they seem to manage quite well with half duplex and *NO* !!! zoo on FM.

Yes, fewer stations ... but most people agree that quite a few European stations need to learn something about disipline, patience and gentlemanly conduct - not to speak of operating poroceedure.

Yesterday there was some sad character deliberately transmitting a series of dah's on top of two stations in QSO, creating deliberate QRM. Obviously with the intelligence of an ameobe (!).

If they have the necessary equipment to do this why on earth don't they utilise it for something sensibe? ... they could even go as far as to have a QSO !!!.

73 John. <la2qaa@...>

3573. ... and everybody came out to play ...

Plenty! of stations on the 290620101722Z pass of HO-68.

Maybe my 'whinging' about the earlier pass was just an inconvenient time.

I'll have to try to remember, the world doesn't turn merely on 'my' whim ... but it should !!!.

I speak about always refurbishing the same stuff and ideas over and over again in a recent AMSAT-BB message... The idea about having the
cross band repeater always turn on was also one of my past post but i was told there was some issues with the equipment who will not permit
unattended use due to some over-heating problem in one rig who does not have a fan to make an air flow around the heatsink as in zero
gravity there is no natural air flow circulation the molecules stays where they are and force ventilation is required.

As i'm not an engineer but how come no one ever think about this before sending an amateur radio rig in space?

Yes i'm second guessing engineers but why we need engineers if we are able to second guess them? It is not their main task to avoid any
second guessing situation?

3575. Milliwatting.

Yahoo group: eu-amsat
Date: 2010-06-30 18:06:40 UTC
From: John Hackett
Topic: 3575 Message: 3575

To whom it may concern,
LA2QAA is now Milliwatting on HO-68 so please listen out for
the Derringer - (a little pistol) - on a downlink of +/- 435.753 CW. I am also
(deliberately)
manual tuning so I hope my 250mW doesn't slide down and QRM you.

To the deliberate QRM'er - don''t bother!! ... (I'll just QRT).

To the alligator SSB'er - spare a thought for the little chap, please.

Thank you.

73 John. <la2qaa@...>

Nota Bena.

Why Milliwatting? ... it's a step down from QRP'ing and requires a little finesse' for
success.

('Anybody' can groan into a microphone with an ERP of 100w).

3576. Milliwatting on HO-68

From: John Hackett
Topic: 3576 Message: 3576

Group,
I'd like to publicly thank Laci HA6NM for his excellent operating and for copying my 200mW CW signal on HO-68 on the 1st of July 2010 at 16:50 UTC.

From my locator of JP33WB to Laci's at JN98PB equates to a 'Miles Per Watt' distance of a little
over 9000 miles or 14,000 kilometers.

3577. CO-65 in Digi mode

Yahoo group: eu-amsat
Date: 2010-07-01 22:35:54 UTC
From: Thomas Frey
Topic: 3577 Message: 3577

Hello All

In July CO-65 (Cute-1.7+APD II) is in digipeater mode during the
weekends, see http://lss.mes.titech.ac.jp/ssp/cute1.7/blog/
The data speed is 9600 bps and the modulation is GMSK (not FSK!).
I think most of us have not a GMSK-modem. Is there a soundcard software
to demodulate 9600 bps GMSK available for free ?

The uplink is 1267.603 MHz, the downlink 437.475 MHz.

3578. P3E News

Yahoo group: eu-amsat
Date: 2010-07-02 14:25:07 UTC
From: Thomas Frey
Topic: 3129 Message: 3578

Erst in Deutsch, dann in Englisch
First in German, then in English

Achim Vollhardt, DH2VA, berichtete ausf?hrlich an der Jahreshauptversammlung 2010 der AMSAT-DL e.V. ?ber die gemeinsame Machbarkeitsstudie von AMSAT-DL und DLR zu einer Mond- und Marsmission. Basis dieser Studie ist die bereits geflogene AMSAT P3D-Satellitenstruktur. Die Vorstandsmitglieder verbrachten zwei Wochen im CEF (Concurrent Engineering Facility) des DLR in Bremen. Trotz unterschiedlicher Standpunkte zur technischen Projektf?hrung bewertete Achim Vollhardt die Zusammenarbeit mit den Mitarbeitern des DLR als sehr konstruktiv und f?r beide Seiten von grossem Nutzen.

Die Ergebnisse der gemeinsamen Studie wurden Anfang Mai 2010 in einer Abschlusspr?sentation beim DLR in K?ln vorgetragen. Im Beisein von Vertretern der DLR-Programmdirektion stellten Peter G?lzow, DB2OS, und Hartmut P?sler, DL1YDD, gemeinsam mit DLR-Vertretern die Ergebnisse der Studie vor. Die Ergebnisse wurden von allen Beteiligten sehr positiv aufgenommen, eine weitere Zusammenarbeit mit dem DLR wird von beiden Seiten positiv beurteilt und angestrebt. Zum ersten Mal wurde von unabh?ngiger Seite die technische Machbarkeit unserer Marsmission best?tigt.

Peter G?lzow sieht die Ergebnisse der Studie sowie den Dialog mit der Politik als wichtiges Fundament, um die Fertigstellung von P3E voranzutreiben
sowie als gewichtiges Argument f?r zuk?nftige Verhandlungen mit m?glichen Geldgebern und Startbetreibern.

Am AMSAT-DL-Symposium war der Telemetrie- und Kommandobetrieb mit der neuen IHU3 f?r P3E das Thema von Mario Lorenz, DL5MLO. Es gab grosse Fortschritte bei der Weiterentwicklung des IHU3-Bordrechners. IPS l?uft und inzwischen arbeitet Mario intensiv an der Implementierung der Turbo-Codes auf der IHU3. Anhand einer Live-Demo demonstrierte er den Betrieb der IHU3 und dem IPS-Betriebssystem sowie der Robustheit des Turbo-Codes.

Durch einige Kontakte auf politischer Ebene und Bem?hungen um Finanzierung wurden andere konkrete Arbeiten an P3E etwas in den Hintergrund gedr?ngt. Auf Einladung des Koordinators f?r Luft- und Raumfahrt der Bundesrepublik Deutschland, dem parlamentarischen Staatssekret?r Peter Hintze, trafen die Vorstandsmitglieder Peter G?lzow und Hartmut P?sler, sowie AMSAT-DL-Mitglied Wilfried Knauer, im Ministerium f?r Wirtschaft und Technologie in Berlin zu einem zweist?ndigen Informationsgespr?ch zusammen.

In English:

Achim Vollhardt, DH2VA, reported in detail at the Annual General Meeting 2010 from AMSAT-DL about the joint feasibility study by AMSAT-DL and DLR

for lunar and Mars missions. Based on this study is the already flown AMSAT P3D satellite structure. The board members spent two weeks in the CEF (Concurrent Engineering Facility) of DLR in Bremen. Despite different views on the technical project management assessed Dr Achim Vollhardt cooperation with the staff of the DLR as very constructive and mutually very useful.

The results of the study were presented in early May 2010 in a final presentation at the DLR in Cologne. In the presence of representatives of the DLR program Directorate, Peter Guelzow, DB2OS, and Hartmut Paesler, DL1YDD, in cooperation with DLR representatives presented the results of the study. The results have been received by all participants very positive, a further cooperation with the DLR is assessed positively by both sides and sought. For the first time the technical feasibility of our Mars mission became confirmed by an independent side.

Peter Guelzow sees the results of the study and the dialogue with politicians
as an important foundation to the completion of P3E and as a strong argument for future negotiations with potential donors and launch operators.

At the Symposium was the telemetry and command operations with the new IHU3 for P3E the topic of Mario Lorenz, DL5MLO. There was great progress in the advancement of the IHU3-board computer. IPS is running and now Mario is working intensively on the implementation of turbo codes on the IHU3. Using a live demo, he demonstrated the operation of the IHU3 and the IPS operating system and the robustness of the turbo codes.

Because of some contacts at the political level and funding efforts were other concrete work on P3E something pushed into the background. At the invitation of the coordinator for air and space of the Federal Republic Germany, the Parliamentary State Secretary Peter Hintze, met the Board members Peter Guelzow, Hartmut Paesler and AMSAT-DL member Wilfried Knauer the Ministry of Economy and Technology in Berlin to a two-hour information session together.

3579. Friedrichshafen balloon payload found but not reached balloon team

Yahoo group: eu-amsat
Date: 2010-07-02 14:41:15 UTC
From: William L
Topic: 3579 Message: 3579

Hi AMSATs,

I just recently got to know that the balloon that went up with the transponder is still missing.

Please check the news:
http://www.balloonproject.eu/

I hope the person who has the box will give it back soon, so the stored data can be downloaded and the flight was not useless.

Good thing is that on both flights the transponder worked well.
The transponder frequencies can not be changed without the specific programmer and software, so listening on the beacon frequency might be helpfull to find its location.

William, PE1RAH

Hi Group.
I always believed that flying a Linear Transponder was the intention anyway, but what I can't fathom is how a Linear Transponder could actually operate within such a limited power budget. Linear Transponders on larger birds sometimes used HELAPS type PA to improve efficiency but I imagine this wont be the case for this satellite. I wish them luck.

Hi Al,

As has been mentioned before, these days there is the power budget available on a 1U CubeSat to support a linear transponder, but I don't expect the power budget will support simultaneous operation of the Interference monitoring, APRS and linear transponder.

Lets hope we see many groups developing linear transponder projects.

Really? Perhaps you (or others in the group) can explain exactly *how* to me. Last time I checked, the solar irradiance constant was about 1380 watts per square metre. A 100mm CUBE collects very little solar power, and of what it does, around 20% (best case) can be converted to electrical energy. I've done the calculations for a 100mm CUBE and the available power, even with high efficiency cells is abysmally poor. I've never seen a meaningful explanation of how to run an (inefficient) linear transponder from such a limited power source, except for limited intermittent operation.

Remember also that the batteries, BCR and other onboard systems also consume already scarce power resources. I do also remember PE1RAH's LE-005 linear transponder design coming in for some criticism for it's power consumption, which at the time I believed was perfectly reasonable.

I'm sure the group would appreciate a genuine explanation, not just 'smoke and mirrors'. Is intermittent operation planned, depending on power state, or will it be a peanut-power transponder? Plenty of questions... no real answers. A meaningful explanation would be most welcome.

Well Thomas. I do know about DELFI. I wrote about it some time before it was launched, in OBSERVATIONS, expressing my support for the concept.

Around that time I also suggested that a better power budget could be obtained by wrapping deployable panels around a smaller 'core' containing only the minimum of essential eqipment... transponder, antennas and command system... daylight-only.

Other methods of increasing solar generation area include the matryoshka (Russian Doll) type arrangement of sliding solar-generator sleeves favoured by Intelsat ... scaled to CUBESAT peoportions.

As to power budget, I initially calculated the power budget for a Cubesat (100*100*100mm) since it is the 'cheap' option, but should you go to a Triple CUBESAT (no longer a genuine CUBESA, IMO) the power situation improves, but do remember that DELFI C-3 is a daylight-only bird... no batteries are a good thing anyway in my opinion, because with no battery to consume power, things do look better for flying a Linear Transponder, in addition to the chance of a longer operating life than with a battery powered bird, if the orbit is adequately high. Delfi-C3 was a good idea, that unfortunately didn't deliver for the amateur radio community.

Of course, you then have the equivalent of three CUBESAT launches to pay for, so is it really still an attractive proposition, and would a completely new design not make more sense?

One thing is for sure, the single CUBESAT format is a lousy one for any linear transponder bird. It was never indended for this end purpose. It is like trying to make a silk purse from a sow's ear.

The Triple Cubesat while better, is still far from ideal. Most of the CUBESAT launches are into pretty low orbits anyway, not ideal for a long-lived comsat. Has anyone looked into the cost of launching a 'large lightweight CUBE'? This could made more sense than messing around with the university-driven small CUBESAT format.

If you consider power generation vs spaceframe size, it quickly becomes apparent that using the standard CUBESAT format is like 'painting yourself into a corner'. It's simply not

suited to the job.

Hello Al and Group

I know, we are in a dilemma. We want to have a HEO satellite with many linear transponders for all bands for zero launch costs. I have exaggerated now. I always come to the conclusion that P3E is the only actual project that comes near this goal.

HO-68 in MEO is also good for DX, but has a lousy scheduling. Why are not both transponders switched on all the time ? Because of a bad power budget ? If yes, why ?

3590. Re: Amateur Satellite to Investigate Power Line Interference

Yahoo group: eu-amsat
Date: 2010-07-05 11:13:38 UTC
From: Al
Topic: 3580 Message: 3590

Hi Group.

For anyone who wants to roll a few numbers around, here are some of mine, including some necessary assumptions.

1) Solar Irradiance Constant. 1380W/square metre.
It used to be quoted as 1440 when I was younger... how 'facts' change :-)

2) One square metre contains 10,000 square centimetres... ergo one square centimetre of area 'sees' 0.138Watts of energy when plane to the sun.

3) A CUBESAT has facets of 100 square centimetres in area, ergo a complete facet 'sees' at most, 100*0.138W, or 13.8 watts energy, but ONLY when directly facing the sun.

Sounds good? Err no, it's not.

4)Here I make the assumption that a typical CUBESAT fact has 80 rather than 100 square CMs of solar generator area (based on what I've seen with real CUBESATs). They need to clear the launch rails.

Still awake?

5) Now we are down to 11.04Watts on the 'useful generating area' of a 'side' facet directly looking at the sun.

6) Now an assumption....The efficiency of a good solar cell is around 20% (yes I know this can be bettered, but would it be in reality?)

7) Now we are down to 2.2 Watts.

8) Satellites spin, so in reality, the average power would be rather higher than this, because multiple facets may be partially illuminated ... so perhaps in the low 3watt region (my assumption).

9) If you include a battery, it requires to be charged, energy subtacted directly from the available power. It's also rather inefficient in converting electricity to chemical changes, and back.
Batteries also have a little reliability issue... being wet chemistry, they inevitably fail given enough time.

Note, From the above, I've omitted the additional losses due to obstructions on the panel facets (bond wires etc) and the losses inherent in the BCR.

You can have some fun doing your own 'back of the beermat' calculations, but I've tried to outline here, in *very* simple terms, the limitations of the Cubesat format.

With some of the new high efficiency solar cells, these figures could easily be bettered, but the available power won't increase by a great deal. Look up whats available and have some fun. It's only primary school arithmetic at this level. In reality it's not so simple

as this to model of course, but these mumbers should give anyone who is still awake a handle on the power issue with CUBESATs. I'd welcome comments please.

Lousy scheduling for whom?
I believe the CAMSAT team is still in the commissioning phase for the bird. Time will tell if they switch on both transponders. I suspect they will not. There are just too many 'alligators' in Europe... trying to run down the battery. Given that, their current strategy probably makes sense. I think they are being 'careful' with their new bird.

```

IN LIGHT OF WHAT I PREVIOUSLY WROTE THE COMMENTS BELOW STILL HOLD TRUE:

I speak about always refurbishing the same stuff and ideas over and over again in a recent AMSAT-BB message... The idea about having the
cross band repeater always turn on was also one of my past post but i was told there was some issues...Probably mistaken on purpose on technical issues but it is now obvious it is a lack of will and leadership in the ARISS
program management.

AND WHAT IT IS EVEN MORE TRUE IS THAT SAREX IS DRIFTING TOWARDS THE SAME AMSAT-BB CENSORSHIP WHO DOES NOT ALLOW ANY COMMENTING WHO IS NOT
IN LINE WITH AMSAT-BB INTEREST...

YOU DON'T BELIEVE IT I JUST CROSS POSTED THIS ONE TO THE EU-AMSAT YAHOO DISCUSSING GROUP JUST CHECK IF YOU CAN READ IT ON THE AMSAT-BB
AND/OR SAREX BB!!!...

I DON'T KNOW WHY SO MANY US CITIZEN DIED FOR KEEPING LIBERTIES WHEN THEIR SONS ARE NOT EVEN RESPECTING THEIR WILL?

AS AN INTERNATIONAL ORGANISATIONI ARISS WHO IS NOW MAINLY CONCERNED WITH ARISS OPERATION ABOARD THE INTERNATIONAL SPACE STATION THEY SHOULD
NOT PUT THE SAREX-BB CENSORED UNDER THE " ACCEPTABLE USE POLICY FOR THE AMSAT PUBLIC MAILING LIST" IMHO.

You can throw a lot of cash in a bucket but if your bucket is dripping you will only be focused on patching the holes...is this is telling
you something!!! AMSAT-NA return on space program and the adjoining DARA dollar for dollar hole patching effort...

Hi Al,

It looks like we're almost in agreement.

24% efficiency is easily achievable these days but clearly after a number of years in space they'll degrade and probably give the figures in your estimate. One day perhaps the 40% efficient cells will come down to a reasonable price but not I think for many years.

With the power available you then have three choices:
1) No battery, transponder only operates when CubeSat is illuminated
2) Use a battery, run less power output, CubeSat limited by life of battery maybe 5+ years
3) The CubeSat starts off with battery power and switches to solar power only when the battery fails

In all cases you need to design the transponder to minimize power consumption.

As Thomas pointed out you can gain even more power by having hinged panels.

Hello Trevor and Al

AMSAT-NA, Binghamton University, State University of New York (SUNY)
and IBM's Heritage Corridor Center for Advanced Studies will build
the NextGen CubeSat with Super capacitors instead of batteries. Would
this help ?

The transponder will be a linear one in DSP technique. I don't know of
an internet site with infos but there is a video available:

I'll watch that with interest, it'll be the first time SuperCaps have been flown on an Amateur satellite, in fact that may never have been flown in space before. Does anyone know if they have ?

> The transponder will be a linear one in DSP technique.

That's derived from the one on ARISSAT-1. While DSP Linear transponder cure the "Alligator" problem that add an overhead in terms of power consumption. The most efficient amateur DSP 435/145 transponder I know of still used an extra 300mw over what a convention linear transponder would consume. I believe the DSP transponder used for ARISSAT-1 has a far higher overhead than that.

For the NextGen that doesn't matter so much because it's a 3U CubeSat so has a lot more solar power available but DSP wouldn't be feasible on a smaller 1U CubeSat.

Hi Group,

Some interesting ideas, but supercaps are still only available in quite small capacitance values (in relative terms). They are ideal for some applications, but I don't think they are yet 'energy-dense' enough to be a practical replacement for batteries... and what would be the advantage anyway? It's still a wet-chemistry technology that will degrade with time, temperature and cycles.

Since these capacitors are still wet-chemistry devices, and nanotechnology based thin-film ones at that, this could bring it's own brand of problems. The dielectric is typically only nanometres thick(1), so what happens when it is bombarded by energetic particles, and don't you think this could be relatively easily tested on the ground first, rather than in space, where a failure is pretty serious? I've never really understood why so many new technologies are being tried in space when they can be more cheaply and easily be tested on the ground, in vacuum / thermovac chambers and by dosing them with ionising radiation from conventional industrial radiography sources. OK, I *do* understand there are very energetic particles that can't be replicated in this way, but the Earth's atmosphere doesn't stop these particles either, so they could be 'tested' on the ground!

DSP should make it possible to contend with the inevitable alligators and with care could also 'slim-down' the transponder downlink power requirements by averaging and selective filtering. It does look like DSP has a good future with linear transponders, and particularly on bigger craft.

I'm not so sure about DSP *not* being applicable to a 1U CUBE. If anything a linear CUBE stands to benefit most from DSP technology, if the power consumption can be tamed. 300mw for the DSP sounds good, especially if you don't need to charge a battery also. Just bin the battery and fly DSP instead, for a sunlight-only and alligator-free long lived ... limited by orbital altitude, mission. With a CUBESAT, that sounds like a sensible option to me.

Hello All

PSLV-C15 with Switzerland's 2nd CubeSat TIsat-1 and Indian StudSat
is launched successfully. See "LATEST NEWS" @ http://www.isro.org/

--

Mit freundlichen Gr?ssen, Regards, 73

From: John Hackett
Topic: 3604 Message: 3604

Hello Al,
I bet you didn't know that AO-7 is orbiting the earth at least !! 200 times a day ... as attested to by the French station that has knocked up more than 2000 contacts this last two months.

I see SV1BSX has also made a few more contacts since I was last on AO-7 - (think about that one).

No kidding!, the state of the log is idiotic! now, a complete shambles, I'm glad I gave threw in
the towel when I did.

Several stations hitting the old girl with high power again today, the transponderr was warbling
like a demented duck but 90% of the stations didn't even bother to QRP ... most likely didn't even know why they should.

It just gets worse and worse, in fact, I hear the (satellite operating) death toll clanging of
the bells.

Nowhere !!! on the Amsat websites do I see recommended operating instructions.

They seem to be only on the AO-7 Resource Page ... but it looks like nobody reads them - and
if they do, they don't seem to take a blind bit of notice.

I had no trouble whatsoever! hearing my own milliwatts today - nor did UA9CS and F1IL so there really *IS* no excuse for the 'power struggle'.

A few of the operators were knocking the transponder silly!.

I've also noticed this "phenomena" a couple of days when AO-7 has been in Mode B. Just hope I'm not one of the alligators... I cannot run more than 8W output on 70 cm from my FT-726 (5W when running 2xFT817...) and I'm always running barefoot on AO-7. When working CW I always QRP down to about 3W output. The SWR on my 70cm X-yagi (which are optimized for 435 MHz) is quite high on 432, so I don't think my signal is among the stronger on Oscar 7.

To bad some operators are abusing "The Old Lady". Think we all should be gentle to her, and she will reward us with many fine DX contacts. K9HF and UA9CS is in the log here, and more to come. I hope...

73!

3606. More milliwatting on HO-68.

Yahoo group: eu-amsat
Date: 2010-07-14 17:08:14 UTC
From: John Hackett
Topic: 3606 Message: 3606

Folks,
Absolutely no problem whatsover to copy my 200mW on HO-68 this evening.

(28 year old FT-290Mk1 barefoot to an Arrow aerial, manual doppler).

However, no 'takers' on the last pass.

Tis' vain to do with more, that which can be done with less.
William Of Occam. 1307.

Nice to have a challenge again after getting bored with it all.

Over here, AO7 at times has been turned into AO-51 with only one QSO allowed. A station would be so strong that only he and the other station in QSO could use the satellite. The transponder was so overwhelmed that any other signal downlink would just disappear.

3608. Another milliwatting epistle.

Yahoo group: eu-amsat
Date: 2010-07-14 19:22:59 UTC
From: John Hackett
Topic: 3608 Message: 3608

Clearing up a (slight?) misunderstanding.

After my recent 'milliwatting' post, one well meaning (?) Ham 'commisserated' with me and advised me that I should try using more power.

I believe the gentleman missed the point completely!

Milliwatters are very seldom 'newcomers' - on the contrary, they are usually the most experienced Amateurs of the bunch.

Personally, I've been at this game since 1966 and have enough ''wallpaper' and awards to build a paper-mache P3D.

Remember ... any clown can emulate a pregnant cow suffering from a stomach ulcer - into a microphone, with a 100 watts and a rusty nail ... but it takes a certain 'finesse' to
be successful with microwatting.

It's generally accepted that the microwatter is an experienced Ham with a good working knowledge of operating proceedure, aerials, propagation and in the case of satellite operating - orbital mechanics.

It may sound blaise' but microwatters have usually gained previous experience at most of the other'disiplines' in Amateur Radio - and are therefore looking for new challenge.

Milliwatting can be compared with EME - top of the line stuff, if you will - and puts into perspective the relative newcomer on the Amsat-bb a couple of years ago with his infamous ... "You need at least! 100 watts to work AO-7".

That would only be true if you were feeding the 100 watts into an oversized 50 ohm resistor!.

When you have learned something about power budgets and the secondary reason of why satellites have beacons - you can call yourself an experienced satellite operator.

A couple of tips ...

1) The beacon is an excellent propagation reference - remember, you're traversing the ionosphere twice!.

2) Your signal should *NEVER* be stronger than the beacon ... it's your reference!.

3) As I have stated many times before ... you should only use 'enough' power to communicate effectively.

As the satellite approches TCA (time of closest approach) you can reduce power by 3dB and nobody will even notice the difference.

Try it !!! ... you will be prolonging the satellites life.

For those wondering why AO-7 was 'warbling' the last couple of days in mode-B ... too many users using too much power.

Remember!, the available power is distributed among the users in the passband.

Don't be a power *HOG* ... QRP by 50% and people '*WILL* still hear you ... at least they will if they have ears and an aerial.

Recommended operating instructions for an ailing AO-7 have been on the AO-7 Resource Page for everyone to read.

Very few have used the opportunity.

Reduce your power by 50% ... and surprise! yourself.

Hello Mike, K9QHO,
Just thank your lucky stars you're not in Europe! - 50 + countries
fighting it out on an FM transponder is absolute! chaos and quite rightly has been designated
a zoo.

I recall Emily W0EEC, now K1DID, and I hooked up on Echolink to work AO-51. The operating proceedure was of a *MUCH* higher standard on your side of the pond.

I use to maintain the AO-7 log together with Emily but gave u a couple of years ago when people started using the log as a 'competition'' ... as opposed to an 'activity' log - which was it's designed purpase.

The statistics are now completely useless! thanks to the 'competion' mentality and errors in reporting etc.

GM1SXX and myself spent a long time recording and analysing data when the beacon was transmitting correct TLM. We were in a continual discussion with Jan King (hence my 'quip' "Long Live the King!" ... but now I've migrated to HO-68 perhaps the battlecry ought to be ...
"Long Live The KUNG".

I was the one who recorded and made known the timer function in 2003. GM1SXX and myself (with the project manager's help, Jan King, now VK3EY, managed to work out that the information in the 1974 Amsat newsletter was in fact incorrect.

It had gone to press just prior tp jan and Karl Meinzer making some changes just prior to launch
in 1974.

Since then there have been countless 'experts' - about one every 6 months - 50% of them redistributing false information based on in correct speculation.

The single most negative aspect is as you correctly summise Mike

3610. Live Webstream of AMSAT-UK Space Colloquium

Yahoo group: eu-amsat
Date: 2010-07-14 22:18:50 UTC
From: Trevor .
Topic: 3610 Message: 3610

The 2010 Space Colloquium - the 25th held by AMSAT-UK, is taking place on July 31 and August 1 at the Holiday Inn in Guildford, England.

As usual there will be many interesting presentations and demonstrations from the developers and users of the ever increasing number of amateur radio satellites. In addition there will be talks on nano propulsion systems, solar sails, cubesat sized linear transponders, the GENSO ground station network, GNU radios and numerous other topics.

It is still possible to attend the meeting itself, although the "early booking" rates may now no longer be available - for booking details see http://www.uk.amsat.org/colloquium

If, however, you are unable to attend in person, we can announce that the batc.tv webstream service will again be provided over the weekend starting from 1000BST (0900UTC) on the Saturday.

The current programme - which is always subject to late changes - can be seen here http://www.uk.amsat.org/content/view/713/284/
again please note that all timings are given BST which is UTC +1.

The BATC.TV webstream will be available here, click on Live Events http://www.batc.tv/

AMSAT-UK

Date: 2010-07-15 18:48:38 UTC
From: John Hackett
Topic: 3612 Message: 3612
Attachments: 1 described; binary payloads are missing from this source WARC

Thanks to Roman, OK1DEU for working my 100 mW on HO-68 this evening.

I had to compete with a couple of power *HOGS* but still managed a 2 minute QSO.

It used to be acceptable proceedure to send QRL? before calling CQ but nobody appears to do it anymore. Three timers th8is evening I was calling CQ on CW with 100 mW only to be *SQUISHED*
by o0perators that started calling CQ without even bothering to ask if the frequency was in use.

They *WOULD* have heard me had they bothered to *LISTEN* before transmitting.

It's very! rare that the propagation is such that people can't hear at least one side of a QSO ...
but to do that they w9uld of course need to use their *EARS*.

It ought to be mandatory to have an understanding of FULL DUPLEX OPERATION.

Anyway, thanks Roman, nice to see ssomebody! using their ears for their primary intended purpose ... and not just for holding their hats up.

73 John. <la2qaa@...>

From: John Hackett
Topic: 3615 Message: 3615

Da! Comrade Alski (& Group),
'Sillywatting' describes it to a T.

Excessive power is absolutely *NOT* necessary but some operators are like sheep ..
they just don't use 'the grey matter' between their ears.

As I implied the other day, a lot of people *WOULD* be surprised if they reduced power
by 50% ... I doubt if the 'receiving' station would even notice thye change. ... and
imagine!
how much it would prolong the satellite's life if 'everybody' did it.

Common sense dictates that you *DON'T* need the same power at TCA as you do at the
horizon. How many regulate their power through a pass? ... I suspect zilch, none, nada,
ingen.

Of course, when the bird finally throws in the towel, the *HOGS* will be the first to
complain ... and blame everybody else !!! ... for not reducing power.

The proverbial viscious circle.

Anyway...

Anyone may ignore my last posting. Just got a bit overwhelmed by the nice words from Alan... What's the radio amateur's most important asset? His/hers ears of course! Anyhow, I just can't understand how anyone can't hear the fine CW-signals from Alan. With me he was a true 579, running MILLIWATTS, and without a *real* RX preamp at my side (I don't count the built-in preamp in my small 70cm PA as a real preamp anyway - I might just as well cranked up the volume by 15dB or so...).

Still, after working TRUE QRP on HF the last 10 years I might have developed good ears, or maybe I was born with them - I don't know, and I don't care. In fact, Alan got my attention on HO-68 when he was calling CQ and actually making a bit of QRM on a SSB-station that I, at first, found interesting. Alans signals, however, were much more interesting for me, since I already knew he was running QRPp and that's it.

By the way, I was running 5 watts into my homebrew "norwegian wood" 6 element X-yagi (DK7ZB design) and on the 70cm RX side I used my likewise homebrew 10 element X-yagi, also DK7ZB-style and built on a wooden boom. Antennas with fixed elevation @ 25-30 degrees or so and a simple TV-rotator. Manual rotation and manual doppler tuning on the old FT-726R. It couldn't be more easy!

Thanks for a nice QSO, Alan, and something really to remember! The rest of you out there should try the same. You may learn something, you see...

3620. OBSERVATIONS FROM NORWAY.

Yahoo group: eu-amsat

OBSERVATIONS FROM NORWAY. 170720102110Z.

Yet another 2m 70cm Diplexer.

I recently purchased an Elk log periodic dual band aerial for portable satellite operating. Unlike the Arrow, it only has a single feed connector and since I use an FT-290 on TX with a TR-851E on RX I needed a duplexer.

While the aerial is designed for dual band FM handhelds, using a single connector, using two
rigs for CW operating poses a slight problem so to operate full duplex a diplexer is necessary.

Building the diplexer should be quite straightforward by perusing the 'pretty' pictures. (OK, maybe not so pretty ... they were taken with an 'El Cheapo' tatty phone camera).

A couple of bits of coax, series-resonant traps and 3 x connectors in a home brew aluminium box and you're good to go.

The box is made from the aluminium cooking tray that was previously 'at home' in the electric oven ... and you ask me why I'm divorced?.

I used Eirie type ceramic trimmers in case I should ever get the urge to use *MASSIVE* power like one complete watt. Seriously, I used them because they were in the junque-box, even though they are quality-wise a bit overkill for this project. (They're microwave trimmers).

The coils were wound with 1mm soft drawn enammelled copper wire 'borrowed' from an RF choke in a 'dead' power supply ... (well, it's dead now!).

The N-connectors came from ... you don't! want to know. The SO-239 came from a non-functioning SWeaR meter.

(Non-functioning because it was 'liberated' previouskly, for parts).

The RG-58 C/U coax was a patch lead that 'paid the price'.

The 'loss' of a quarter wave RG-58 at 2m is INSIGNIFICANT - (and I run milliwatts) - but if you want to split hairs, by all means use higher quality coax.

John, (!)

Have you been able to try your Elk yet? I'm very curious about this little LPA, and seriously thinking about ordering one. Think this would be a nice "on the go" antenna for just any kind of activities on 145/430. The cost, abt 125 USD + shipping, seems to be ok and the reviews on eham.net is more than favourable. How long was the delivery time to LA-land from the US, and for how long did the norwegian "TOLL-Gestapo" keep you liberated from your antenna?

3623. Two New Indonesian Satellites to Launch Next Year

Yahoo group: eu-amsat

From: Al
Topic: 3623 Message: 3623

July 16, 2010

Fidelis E Satriastanti & Ismira Lutfia
Two New Indonesian Satellites to Launch Next Year

Having launched its first locally made satellite in 2007, Indonesia is now looking to launch another two next year for both communications and remote-sensing applications.

The Lapan-A2 and Lapan-Orari are categorized as microsatellites, weighing 68 and 70 kilograms, respectively, and have been developed in-house by the National Aeronautics and Space Agency (Lapan). Both are scheduled to be put into orbit in September 2011 by an Indian rocket.

Toto Marnanto Kadri, head of the Aerospace Electronics Technology Center at the agency, said the satellites were designed, assembled and tested in Indonesia.

"They're both very small, measuring 45-by-45-by-33 centimeters, so that obviates the need to buy our own satellite launcher," he said. "Instead, we'll be piggybacking on India's launcher from their base in Sriharikota, because they plan to put their own satellite, the Astrosat, into orbit next year."

He said Lapan's satellites differed from other remote-sensing satellites in that they would run in an equatorial orbit rather than a polar one.

"It'll be very interesting, because normally the satellites in current use, such as Landsat [United States] and SPOT [France], are on polar orbits, which means their coverage of Indonesia is relatively low," Toto said.

"During a 24-hour cycle, a satellite in polar orbit will only pass over Indonesia very briefly, yielding only two to four sets of data.

"However, a satellite in equatorial orbit at a height of 650 kilometers will pass over Indonesia for up to 97 minutes, yielding 14.7 sets of data."

Passes occurring during daylight hours boost data collection by a factor of five to six, he said.

The Lapan-A2 satellite is equipped with a Kappa PAL color video camera and has a high-ground resolution of 5.96 meters and coverage of 80 kilometers.

"The satellite is unique because it has a digital camera that can monitor areas affected by natural disasters," Toto said.

The satellite will also carry an Automatic Identification System to tag ships of more than 200 tons, which are required by the International Maritime Organization to have an AIS tracking device.

Toto said the system would be able to pick up the identity, position, speed, destination and specifications of ships in Indonesian waters.

The Lapan-Orari satellite is a joint venture between Lapan and the Indonesian Amateur Radio Organization (Orari), and was designed by a team of 20 from both organizations, said Wisnu Widjaja, deputy secretary general of Orari.

"This is the first-ever amateur radio satellite project in Southeast Asia," he said.

The satellite is equipped with an amateur radio Automatic Position Reporting System, digital data relay and amateur radio analog voice communication relay.

"Orari has APRS, which can transmit both text and voice communication, and could prove very useful in the event of major natural disasters such as earthquakes in which conventional communications infrastructure may be disabled," Toto said.

Wisnu said that radio networks that used high frequency to super high frequency channels for transmission were sometimes affected by the weather when used at ground level.

"But that won't happen in the case of a satellite, therefore we can rely on satellite transmissions for disaster mitigation because they will always work regardless of the weather conditions, not to mention the much wider coverage too," he said.

However, he did say conventional communications would remain the backbone of the amateur radio system.

"The satellite will serve a complementary function to the existing transmission modes," he said.

Toto said the Lapan-Orari satellite featured three multiband spectral imaging cameras with 16.7 meters of ground resolution and 101.87 kilometers of coverage, specifications that made it ideal for use in surveys by the forestry and agriculture ministries.

Wisnu added: "The cameras will be very useful for pinpointing the location of forest fires and hot spots, for instance."

Hello Al and Group

If I'm informed correctly Lapan-Orari and Lapan-A2 will launch with Megha-Tropiques as primary payload in an 8? inclination. If this is correct, both satellites will never be seen in Europe.

Hi Group,
Thomas is correct, These birds will be going to an equatorial orbit and therefore not be visible to Europen users. Thanks for that Thomas.

Hi!

VE2DWE posted a message to this list with the same subject line
as this one, with text that appeared to be from me. I did not
post any of what was in that earlier message. I don't even have
a DSTAR-capable radio at this time. I had posted on the AMSAT-BB
a message with some statistics related to my 3-10 July 2010 trip
to western Canada, where I worked satellites while I was up there.
The original message I posted is in the AMSAT-BB archive at:

http://amsat.org/pipermail/amsat-bb/2010-July/028507.html

and the text of that message is repeated below. I tried to work
Europe, on various AO-7 and HO-68 passes while I was there, but
was not successful. Maybe on a future trip.

73!

Patrick WD9EWK/VA7EWK

(text of my posting on the AMSAT-BB follows)

Subject: [amsat-bb] VA7EWK 3-10 July stats and wrap-up
From: Patrick STODDARD (WD9EWK/VA7EWK)
Date: Sun Jul 18 20:28:04 PDT 2010

Hi!

I have started work on the QSL cards from my recent trip to Canada,
and will also update my web page with photos and more information
about my trip. It was a fun time, and by far the longest satellite-
related trip I have taken. Along with the flights between Phoenix and
Vancouver, I drove 3024km (1879 miles) in 8 days according to the
receipt I received when I returned the car to Vancouver airport on
11 July. The driving in British Columbia was a few miles/km less than
the distance I drove on my trip into Utah last year (that was a
1905-mile/3065km trip), but overall I traveled much further this
July than either of my previous July road trips in 2008 or 2009 when
the Phoenix-Vancouver flights are added in.

During the time I worked the radios (3-10 July), I logged 391 QSOs
from 9 different grids. Locations included one grid boundary
(CN79/CO70, at Campbell River on Vancouver Island), the Canada/USA
international border (standing near the Peace Arch south of Vancouver,
on 8 July), a mountaintop (Whistler Mountain, on 10 July), and even
from a ship (a ferry sailing between Vancouver Island and Metro

Vancouver, on 7 July). I tried to work from CO50, but could not get to a place that allowed for a good view of the sky, even after making a 90km/55-mile detour out there on 5 July in the hope of finding some place that might work for satellites. On my first attempt to work many passes from CO80 on 9 July, I ended up working a few passes there followed by a long road trip through CO80, CO90, and CO99 before returning to my motel in Vancouver (driving 671km/417 miles that day!) and trying again the next day with more success.

I was able to work SSB and FM, although I only worked one VO-52 pass on the first full day I was on Vancouver Island (4 July). I generally used the VO-52 pass times for travel to a destination, or looked to work HO-68 with its larger footprint when the pass times were close. FO-29 and (when in mode B) AO-7 were good for late-afternoon and early-evening passes. HO-68 in FM was a nice satellite to have available during the week, for the longer-distance QSOs compared to the other 3 FM satellites. Despite trying for passes on AO-7 and HO-68 that covered parts of Europe during the week, no QSOs were logged with that continent.

By satellite, here are numbers of satellite QSOs VA7EWK logged in FM:

AO-27: 97
AO-51: 112
HO-68: 73
SO-50: 47
(329 QSOs in FM - 84.1% of total)

and in other modes:

AO-7: 30 in SSB, 2 in CW
FO-29: 23, all SSB
VO-52: 7, all SSB
(62 QSOs in modes other than FM - 15.9% of total)

I had my normal satellite station with me, and I hoped to make use of the SSB satellites whenever I could. I worked many AO-7 and FO-29 passes, including some on AO-7 where I talked to myself and maybe some polar bears in the Arctic. :-) Having access to those two satellites in particular helped some who were not able to work VA7EWK on the FM passes due to either the small common windows on those passes or the congestion on the FM passes. Or, another way of looking at the SSB effort could be "if Adrian AA5UK could work SSB from Hawaii, then I should be able to do the same from Canada". ;-) I worked WC7V and W6ZKH in CW on an AO-7 pass from CO60 for my only QSOs in that mode during this trip.

Grids... I was able to operate from the 4 grids on Vancouver Island I intended to make the biggest effort - CN78, CN79, CO60, and CO70. I ended up working some passes from CN88 in and around Victoria on 7 July before returning to Vancouver, which included some operating from the western end of the Trans-Canada Highway (a place with a good view of the sky, even with the steady stream of tourists around there).

On the Lower Mainland, I operated from CN89 during parts of 2 days, as well as 3 other grids - CN99, CO80, and CO90. The breakout by grid:

CN78: 56 (from Ucluelet on the Pacific side of Vancouver Island, 5 July)
CN79: 21 (from Port Alberni on Vancouver Island, 6 and 7 July - not including QSOs made at CN79/CO70 boundary)
CN79/CO70: 85 (all made from Campbell River, 4 and 6 July)
CN88: 25 (3 locations in/near Victoria, plus 2 QSOs made from a ferry sailing toward Vancouver - all on 7 July)
CN89: 59 (24 @ Burnaby on 3 July, 19 @ Surrey on 8 July, 16 @ Canada/USA border on 8 July)
CN99: 12 (3 passes on evening of 9 July)
CO60: 60 (Port Hardy, on 5 July)
CO80: 53 (3 locations in/around Whistler on 9 and 10 July, plus another location NE of Pemberton on 9 July)
CO90: 20 (one AO-51 pass on 9 July)

I was able to attempt operating SSB from all grids except for CN88, CO80, and CO90. CN89 was not a priority for me, although I ended up working a few passes shortly after my arrival in Vancouver on 3 July and some on 8 July as I drove down toward the Canada/USA border. I had not mentioned my plans to attempt QSOs on the international border publicly, since I had no idea if the authorities on either side would attempt to stop me from doing this. I took the "try it, and ask for forgiveness later" approach - which worked. In fact, 2 US Customs officers walked by me and only said "hello" - no questions about my radio gear or what I was doing at one of the border markers in the park that runs between the Customs buildings on each side of the border. Same thing with operating atop Whistler Mountain, where I worked 4 passes on 10 July - probably the best location in all of CO80 for satellite work - and the impromptu effort during a western AO-27 pass from the ferry sailing between Vancouver Island (Swartz Bay terminal) and Metro Vancouver (Tsawwassen terminal). If I had worked an AO-51 or SO-50 pass instead of the AO-27 pass, I may have had better luck. There's not much of the 7-minute AO-27 repeater time available to satellite operators that far north on the best passes.

When it comes to shipborne operating, I am a novice at that. This was my first, and only, time trying that form of satellite operating. I have a new appreciation of the efforts guys like Allen N5AFV and Andy W5ACM (among others) make when trying to get on the satellites from a ship. I may have been able to use my log periodic for that AO-27 pass, but did not want to attract undue attention with that antenna as opposed to the telescoping whip on my HT.

When I post photos to my web page shortly, some of those photos will include the carry-on bag which contained my station excluding my Elk log periodic, some telescoping whips for my HT, and other accessories that were packed in a checked bag to avoid issues with airport security checks in Phoenix and Vancouver. I packed my two FT-817NDs, IC-2820H

dual-band FM mobile radio, IC-T7H HT, Heil Traveler headset/mic I use with the FT-817NDs, along with cables, diplexer, GPS receiver, spare AA batteries, and my digital recorder into that bag. I also have some photos of the small duffel bag that I used to carry my HT, log periodic, and other accessories up to Whistler Mountain - and too bad I didn't make more time to work from up there, in SSB and FM. An observation deck on the building atop Whistler Mountain was a great operating location. Maybe on another trip, or maybe someone who lives up there will try that in the future (I still don't have CO80 in my log).

After this trip, coupled with my Dayton trip in May when I also took my all-mode satellite station, I think I will do this on future trips even if I am flying. I am already looking at future destinations for trips where I can enjoy the sights and enjoy working the radio as I did up in British Columbia - and not just Canadian destinations. I now know I can get on FM and SSB satellites from wherever I go, and being away from home isn't a problem for that.

Thanks to everyone who made QSOs with VA7EWK during that week. And special thanks to John K8YSE for his web site complete with MP3 audio from selected FM satellite passes and posting some messages to the -BB on my behalf while I was up there. It was very interesting to hear some of those passes from his perspective, along with my own recordings, throughout the week. Now, back to working on the QSL cards...

From: Al
Topic: 3627 Message: 3627

Hi,

I keep in touch with Simon, 2E0HTS in Baildon, Yorkshire. He works as a welding tech in a college there and is a keen radio amateur. He runs an excellent BLOG at

http://www.hamradiooperator.blogspot.com/

Some of his Youtube radio movies below.

satellite (SSB) QSO with ON7EQ
http://www.youtube.com/watch?v=y4N0x3BzwUg&feature=PlayList&p=0E2BBCB1012C5EB5&playnext=1&index=4

Satellite is demanding. You have to tune for doppler, operate, point to the satellite,cope with the round-trip time delays, fill in the log etc ... all at the same time.

satellite communications are FULL DUPLEX.... talk and listen like a telephone conversation, but with a bit of time delay and constant frequency drift (Doppler) that needs to be tracked by hand or by computer.

Operating satellite (SSB) via VO-52.
http://www.youtube.com/watch?v=G-v6N4xtFmw

Some satellites can handle FM.
Here's an FM QSO via the new Chinese Hope Oscar 68 satellite.

http://www.youtube.com/watch?v=kCZXh1IokKQ

and QRP Operation from the Yorkshire moors....using an FT817.

http://www.youtube.com/watch?v=LVGqP4D6YIs&feature=related

Just a flavour of the fun you can have with Amateur radio.

Enjoy.
Al.

3628. dah, dit, dah, dit ... (one hundred).

Here's one for those that still believe you need 100 watts to work a satellite.

This card confirms I used 100 milliwatts on the HO-68 CW QSO.

The uplink was on a 28 year old FT-290 running barefoot to a 3 element 'Arrow'.
The downlink was on an aging TR-851E to a homebrew 6 element yagi.
Manual doppler tuning.
No preamp.

When I'm portable, the rotor is of the 'Armstrong' variety.

As can be envisaged ... you *DON'T* have to be as affluent as Donald Trump(et) to be able to operate satellites.

73 John. <la2qaa@amsat.org>

Hello folks,
This goes a long way to why Roman (OK1DEU) can hear my 100mW so well.
(see pic). These days, I only transmit on an Arrow or an Elk, consequently, to be honest, Roman's aerial is doing most of the actual 'work'.

73 John. <la2qaa@...>

3632. IOTA ... (Islands On The Air).

Yahoo group: eu-amsat

From: John Hackett
Topic: 3632 Message: 3632

INFORMATION FOR IOTA HUNTERS.

Normally, in a satellite exchange, I only give my locator (JP33WB) - but my QTH is in fact FREI ISLAND, IOTA EU 36, located at 63.02 degrees North and 7.48 degrees East.

It's just too long winded giving the entire QTH designation on CW so for the IOTA hunters, please be aware that JP33WB is IOTA EU-36.

I've lived on Frei Island for the past 21 years. Previous to that, my QTH was Gossen Island,
IOTA 56.

I've been involved with the IOTA program since it was started in the early 80's.

I've worked the analogue satellites daily from and including RS-10 up to and including HO-68
- except for 1 year AWOL (hospital) in 1997 - 1998.

The 'station' is still operated daily ... but in a much smaller capacity. Milliwatting now instead
of QRP, skill over *BRUTE* force of 2 watts.

100mW ito an 'Arrow' is more than enough on HO-68.

It still cracks me up thinking about K4***'s ... "You need at least 100w and a good antenna to work AO-7" ... you probably do - if you use a 50 ohm resistor as an aerial.

Incidentally, just the other day I was chatting to a station who mentioned he was G-QRP 13,000 and something-or-other ...

It made me realise how time flies, I was G-QRP nr 74.

You wrote: "Plenty of other CUBESATs have flown masquerading as
'amateur radio birds'. Hopefully this mission will be different."

Hopefully they use commercial frequencies for their commercial
experiments. Otherwise its an intruder and not an amateur radio
satellite! Our community has to be careful in dividing satellites,
CubeSats, into "HAM radio" and "not HAM Radio" satellites.

A new trend that's worry me are the new Indian Student satellites.
The first one flown with a "Packet Radio mailbox" was ANASat.
The actual launched StudSat was a "HAM bird" for about 2 days
with its CW-beacon, see http://www.teamstudsat.com/live.html.
Then they switched over to a data link on 437.505 MHz. On the
homepage http://www.teamstudsat.com/ you can read:

"Satellite Completed the beacon mode of communication and has entered
the mission mode, where in it will transmit encrypted data at 437.505
MHz and will not send the beacon."

This is forbidden and illegal!!

If we classifies StudSat as a HAM radio satellite, then we have
lost the game. And there are many more (Cube)Sats who appears
with amateur frequencies on board in the future. Please be critical.

This are our problems and not CubeSats in general.

3636. 200mW on HO-68.

Yahoo group: eu-amsat
Date: 2010-07-30 18:02:24 UTC
From: John Hackett
Topic: 3636 Message: 3636
Attachments: 1 described; binary payloads are missing from this source WARC

Hello Roman, OK1DEU,
Excellent! CW operating on HO-68 - and thanks for copying my QRP again.

This time I was using 200mW from an FT-290RII barefoot to a 3 element 'Arrow' aerial on the 2m uplink
and a homebrew 6 element yagi on 70cm, no preamp.

This time I deliberately *DIDN'T* turn the rotor - (fixed elevation at 20 degrees) - to illustrate that you *DON'T* need a lot of power or exxpensive equipment to work HO-68.

However ... good operating proceeedure, like Roman's ... helps a great deal.

I CC'd this mail to the group ... you never know!, somebody might get the message.

Have a good day Roman, no need for another card.

73 John. <la2qaa@...>

3637. Food for thought.

3638. ZRO type test.

Yahoo group: eu-amsat
Date: 2010-07-30 19:42:55 UTC
From: John Hackett
Topic: 3638 Message: 3638

Group,
After great success with CW milliwatting on HO-68 I intend to conduct a ZRO type test with OK1DEU the next time HO-68 is in analogue mode.

For those too young to remember, the ZRO tests were a series of tests conducted on the HRO's to test
the sensitivity of your receiving equipment.

CW text was transmitted and the power level was progressively decreased by 3dB until until the signal
was *REALLY* weak ... thereby 'testing' your receive capability.

Err ... I can assure! you ... you wouldn't get far with FM techniques..

Hi John,

maybe I am wrong but in my opinion the transponder output power of HO-68 is constant.

So your ZRO test would be an uplink test for very weak signals. Is this in fact correct?

Hi Mike,
I believe you misunderstood my post.

I actually said *ZRO like* test ... (that is to say, my own transmitted signal) ... reducing it in 2 x 3dB
increments from 200mW down to 50mW ... as Roman suggested.

I mentioned it on the reflector for the sole purpose of illustrating that high power - (a *relative* term) -
is *NOT* necessary on HO-68.

You're quite correct in that HO-68's beacon is provisionally 'fixed' at 200mW.

Gentlemen

John is right. Linear means, if I transmit with low power, the transponder translates my signal linear into a low power signal. Same with my QRO signal.
Thats the difference to a repeater. There you have always the same or repeaters
downlink power.

But I don't know if HO-68's Linear transponder is in SDR technique. If yes if a ZRO test would work correctly ?

Group,
Mike, DK3WN has come up with an excellent suggestion.

He suggests an interesting experiment on HO-68, namely, a ZRO type test where stations can test their receiving capability.

For those unfamiliar with the concept, here's a brief explanation.

.....
.....

ZRO Memorial Technical Achievement Award Program
The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" was most recently held on AMSAT OSCAR-13. This activity is a test of operating skill and equipment performance.

During a typical ZRO run, a control station will send numeric code groups using CW at 10 words-per-minute. At the beginning of the run, uplink power from the control station is set to match the general beacon downlink strength. This is level "zero". The control operator will send and repeat a random five-digit number, then lower his uplink power by 3 dB (half power) and repeat the procedure with a new random number (level "1"). This will continue to a level 30 dB below the beacon (level "A").

A participating listener monitors the downlink signals till he can no longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is to improve home-station performance to a point where the lower-level downlink signals can be copied (levels 6 through A). To date, only one station (Darrel Emerson AA7FV) has successfully copied level "A".

With AO-13 out of commission, the ZRO test is not being held.

.....
.....

There will be no awards available for an HO-68 test, it will merely allow operators to test their receiving capability at diminishing power levels. However, it will follow the general principle of ZRO tests held on

P3E and earlier HEO satellites ... but using 5 figure 'letter' groups as opposed to figure groups.

('Figures' may be copied at the 200mW level from the beacon anytime).

Each consequative set of 5 figure groups would be attenuated by 3Db.

Let me know if there is sufficient interest ... otherwise there wouldn't be much point in taking up
transponder space if nobody is interested.

The object of the exercise would also be to illustrate that high power is detrimental to the satellite.

73 John. <la2qaa@...>

the Amsat Symposium this weekend was great! My very first time on such an event.
It was nice to hear Peter on HEO and P-5A. Lot's of interesting new technologies out of Europe. Will be there for the next one!

Group,
Mike, DK3WN has come up with an excellent suggestion.

He suggests an interesting experiment on HO-68, namely, a ZRO type test where stations can test their receiving capability.

For those unfamiliar with the concept, here's a brief explanation.

.....
.....

ZRO Memorial Technical Achievement Award Program

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" was most recently held on AMSAT OSCAR-13. This activity is a test of operating skill and equipment performance.
During a typical ZRO run, a control station will send numeric code groups using CW at 10 words-per-minute. At the beginning of the run, uplink power from the control station is set to match the general beacon downlink strength. This is level "zero". The control operator will send and repeat a random five-digit number, then lower his uplink power by 3 dB (half power) and repeat the procedure with a new random number (level "1"). This will continue to a level 30 dB below the beacon (level "A").
A participating listener monitors the downlink signals till he can no longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is to improve home-station performance to a point where the lower-level downlink signals can be copied (levels 6 through A). To date, only one station (Darrel Emerson AA7FV) has successfully copied level "A".
With AO-13 out of commission, the ZRO test is not being held.

.....
.....

There will be no awards available for an HO-68 test, it will merely allow operators to test their receiving capability at diminishing power levels. However, it will follow the general principle of ZRO tests held on

P3E and earlier HEO satellites ... but using 5 figure 'letter' groups as opposed to figure groups.

('Figures' may be copied at the 200mW level from the beacon anytime).

Each consequative set of 5 figure groups would be attenuated by 3Db.

Let me know if there is sufficient interest ... otherwise there wouldn't be much point in taking up
transponder space if nobody is interested.

The object of the exercise would also be to illustrate that high power is detrimental to the satellite.

Hello John and Group

This could be an interesting experiment to know:

a) is the transponder built in DSP-technique (SDX) or
b) in discrete technique

If in a) would the input of all signals be fixed to the same level ?
If yes, a ZRO test would not work. Try it out first and ask later.

QSL Thomas,
I've already tested ther concept with Roman OK1DEU as well as my own *private*
ZRO type tests before I started waffling about milliwatting on HO-68.

Reducing uplink power reduces downlink power linearly so a ZRO type of experiment *WILL*
work as envisaged.

I'm hoping such an experiment will convince operators to try to reduce power by 50% - as I
have previously suggested ... at least to try it at TCA - (time of closest approach).

I forgot to mention in my earlier posts ... OK1DEU copied my 200mW with the satellite only
3 degrees
above the horizon ... with me using simple aerials.

Group,
A pair of control operators have already had a successful D-Star QSO via AO-27.

In Europe we have the Belgian OUFTI-1 scheduled on the Vega launch later this year ... but AO-27
is still switched on for about two minutes each day, around midday over Frei Island with 500mW.

Do we have anyone in the group with D-Star equipment, home in the middle of the day, who operates
AO-27 ??.

It would be interesting to see if D-Star TV fares any better than PSK31 as a satellite 'mode'.

Glad to hear you enjoyed it Luciano.

For those how weren't able to watch it at the weekend the videos of the lectures should be available on the www.batc.tv web site in a couple of weeks time.

This was an interesting story, it looks like there may be more 'geostationary' slots available than previously thought, see

http://www.southgatearc.org/news/july2010/offset_geostationary_orbits.htm

But the big problem for Amateur still remains getting payloads into those orbits.

Trevor,

I was impressed!
Until that day I wasn't aware of that much European Technology. The more I get in contact with Europe the more I learn!

There where several interesting lectures but one won't catch every little piece of it if he doesn't enjoy all extra activities.

Getting to know people, making friends, having fun at actions and raffles is just part of the Colloquium.

At the end of the day I met people who are improving our hobby and some who are the future of it, icons whose work and dedication shall be remembered as islands of excellence.

I'm glad I was there and will do my best to attend next year!

Hi AMSATs,

Like Luciano said, it was very nice to getting to know people and making friends. I also enjoyed the Colloquium as it was also my first time at AMSAT-UK.

The thing I missed was P3e, or some other high altitude satellite to make QSO's with. Althought we still enjoyed the nice stories of AO-10, AO13, P3d :o) From what I've seen (also at other events) I believe these good times are over, as the CubeSats gaining more space and increase launch prices.

I am looking forward to the P3e HEO, so maybe next time I can chat to Luciano in Brazil by a real satellite rather then like now by internet :o)

Hello William

Glad to see that you are looking forward for P3E. You are at the right place here for the latest news about P3E. The last news you can read here:

http://www.southgatearc.org/news/july2010/phase_3e_news.htm
http://www.southgatearc.org/news/may2010/p3e_microwave_transponder.htm
http://www.southgatearc.org/news/july2008/p3e_update.htm

And more on
http://www.amsat-dl.org/index.php/satelliten-mainmenu-76/ersicht-aller-mainmenu-102

But I can't give you a show like Peter did. :-)

Amusingly, the attempts at deliberate QRM persist ... despite their complete failure.

On thae last HO-68 pass, an Italian 'gentleman' decided to call CQ on top of my QRP, no matter whether I moved up or down - to leave him to it.

As per usual with such operators, the faster he tried to send - the more mistakes he made ... thereby proving his (in)competance as an operator.

There ought to be an award for such childish behavious. I''ve never managed to understand why grown people spend money on amateur equipment, to disturb others ... instead of having a QSO.

A good clean QRP signal will *Always* be more readable than a series of mistakes from an operator
trying to send faster than he's comfortable with or capable of.

Usually, such people just looking for attention - (yes, we can all hear you).

There you go !!! sir ... you're getting your 'attention'.

Clown.

Hello John

In the schedule before it was "FM/PACSAT" scheduled for/until 8th August. If I'm right, that after a week of only "FM/PACSAT" a week of mixed modes follows at Sunday with "CW/SSB" ?

Topic: 3655 Message: 3658

Hello Thomas,
The HO-68 schedule is following it's normal pattern of one week FM voice (with the 67Hz tone) - plus 'digital' (Pacsat) ... followed by one week of 'linear' operation with mixed modes, (CW/SSB).

The weekly schedule changes, as you correctly surmise, every Sunday evening GMT.

There are *occasional* deviations from the weekly schedule for special events and sometimes 'special' modes like SSTV.

Unfortunately, it appears that some people don't always read the schedule.

That, we can't do anything about - except request they read it either here, on the Amsat-bb, on the
HO-68 blog. on Mike's website (DK3WN), on Observations or on the Southgate (London Wireless Club) site.

It's probably posted at other places too.

Hello John

In the schedule before it was "FM/PACSAT" scheduled for/until 8th

August. If I'm right, that after a week of only "FM/PACSAT" a
week of

mixed modes follows at Sunday with "CW/SSB" ?

3660. Question about CubeSat and PC/104 connector

Yahoo group: eu-amsat
Date: 2010-08-15 11:56:03 UTC
From: William L
Topic: 3660 Message: 3660

Hello AMSATs,

During the AMSAT-UK Colloquium I have presented my CubeSat size linear transponder. There I got to know more about the PC/104 connector, which is used in many CubeSat projects.

My transponder design doesn't have this PC/104 connector, because when I designed it I didn't see any standard that was accepted. As I got requests for a design with the PC/104 connector I like to know how well this connector is now a standard in CubeSat world ?

The PC/104 is a huge connector and "eats" a lot of board space and also adds extra weight too(104 copper pins). Nevertheless, when it is a (final) standard and interrest is available I am concidering to adapt my transponder design with this PC/104 connector.

To do so I need to know the details of the board sizes and placement of the PC/104 connector on the board. Does anyone have these details, or know where I can find these ?

Many thanks,

73 William Leijenaar

Hi William.

PC/104 as best I can tell is a standard for embedded computers/controllers. There seems to be quite a lot of info out there on the wobbly-wide-web about PC/104 embedded controller standard.

http://en.wikipedia.org/wiki/PC/104
http://www.interfacebus.com/Design_Connector_PC104.html
http://www.pc104.org/
http://www.pc104.org/pc104_plus_specs.php
http://www.interfacebus.com/Design_PC104_Pinout.html
http://www.controlled.com/pc104faq/

Hopefully you will find something useful there.

3663. Clyde Space

Yahoo group: eu-amsat
Date: 2010-08-16 21:08:54 UTC
From: m5aka
Topic: 3663 Message: 3663

Clyde Space are a Scottish company that are catering for the growing CubeSat market (just wish there were more with transponders).

An interview given at the Farnborough Air Show can be seen at

http://www.southgatearc.org/news/august2010/clyde_space_interview.htm

and there is also a link there to the video of the presentation that Clyde Space gave at the AMSAT-UK Colloquium.

What struck me about the presentation was the comment that the company had supplied parts for 20 CubeSats but none of them had yet flown. This probably indicates a shortage of launch opportunities, a shortage of funding to buy a launch or the fact that some CubeSats are built without them ever intending to fly - the educational benefit I guess is derived from the design, assembly testing and project management aspects.

From: William L
Topic: 3660 Message: 3664

Hello Al,

Thanks for your reply.
It took me some time to find out which connector is used in the CubeSats, as I seen several kinds of connectors and was focussed on 104pins. With some comparing of pictures it seems to be the PC/104 Plus connector which has 120pins and not 104pins I was focussed on.

A quick check shows that I even have space left compared to my design, so I can add some features like HELAPS to increase efficiency.

Thanks for your help,

3666. Knife edge QRP.

Yahoo group: eu-amsat
Date: 2010-08-22 16:58:10 UTC
From: John Hackett
Topic: 3666 Message: 3666

Group,
For anyone interested ...

Very interesting knife-edge propagation QSO's on AO-7 this aftwernoon/evening using FREIKOLLEN, the
largest mountain on the island as the secondary takeoff - (reflector).

I did this previously from my last QTH with about 40 watts to a 6 element yagi but today I worked 4 stations
on a single pass with hust 5 watts to the same 6 element homebrew yagi.

Considering I'm not *allowed* to have anything but a TV aerial at the new QTH I appear to be doing OK.

Unfortunately, the neighbours complain if I use anything above 200mW on 2m so I'm QRPp on HO-68 but
QRO !!! on AO-7 with a giant 2 to 5 watts - depending on the propagation. The good operators all seem
to hear me OK with low power.

3667. Re: Knife edge QRP.

Yes, you're very loud on AO-7! I've heard you every pass, but only wkd you once. I'm not like some of the others, that absolutely MUST have a QSO every single pass...

By the way, HO-68 had a nice pass abt some 20 mins ago. I was QRO+++ on the sat with my 8W output from the old FT-726R. Not much activity, but worked VE8EV, John in CP38. Quite happy with that!

Regards,

Hans / LA2MOA

Privet Igor, UA9CS,
My apologies for not catching your call the first time around on the last pass of AO-7 just now.

There was terrible QRM on the latter two passes from the ES Gentleman. Maybe not able to hear my QRP
but should! have heard the other stations who answering my call ... they had no problem copying me - but
then ... they were using their ears for listening - instead of just holding their hats up off their eyes.

Hello John

AO-7 was active from 15.11.1974 (launch) 6.5 years to mid 1980 and
is active now from 21.6.2002 8 years 2 months until today. Correct ?

Group,
200mW on HO-68 mode-J gives a far stronger downlink signal than 28 watts on AO-7 mode-B.

Taking into account the orbit distance discrepancy, similar propagation anomolies (yesterday) and the same equipment being used - (just the mode change for the aerials) - it's an interesting observation.

I'm of the opinion that HO-68's receiver is on par with the veritable old RS-10 one - which was *VERY*
sensitive.

I've asked for details/diagrams/information but so far my requests have not been acknowledged.

I'd really like to compare HO-68 to RS-10.

Could it be down to dramatically reduced TX signal levels from AO-7.

Given its age the solar panels must be giving only a tiny fraction of the power they did in the 1970's ?

Hi Group,

I think there's little doubt that this is the case. The solar panel cover-glasses will have been degraded by decades of exposure to a harsh radiation environment, reducing the TX power to a fraction, a small fraction, of it's previous value.
The proof for that is.

1-AO7 is now a lot weaker than it used to be.
and
2- It FM's badly in the presence of strong signals, even when in full sunlight.

At the same time, the receive system seems to be as sensitive as ever it was, and it was (and still is) *very* sensitive indeed.

Equally interesting to me at least, is that modern satellites can do considerably better than older ones in respect of long term reliable power generation. Solar generators can be treated by nitriding to provide greater radiation tolerance, while at the same time, batteries have only improved 'a bit' and battery failure still plague satellite builders and end many satellite missions prematurely, and not just amateur birds.
AO7 probably still has some useful things to teach us.

I wasn't even a licensed radio amateur whan it was launched, but it's return from the dead has given both myself and LA2QAA a great opportunity to find out what old sick satellites can still achieve, and what they can tell us. AO7's 'second life' has been a great source of 'self-training' for both John and myself.

You're absolutely right Trevor.
Al and I wrote an article on the subject a couple of years ago.

It's on the OBSERVATIONS website but I can't remember where we put it - (category).

After accumulating space-dust over a period of 36 years (!) the solar panels are obviously degraded.

Al uses solar power for his station and I recommended a weekly wipe with a yellow duster and a
quick squirt with Fairy Liquid but a similar operation would be impossible on AO-t7

Maybe somebody should design a mini Morris Minor type windscreen wiper for future solar panels.
(tongue-in-cheek).

NB.

I assume the AO-7 solar arrays are also subject to microscopic particle 'sandblasting' as well.

Yes they will be, I'm still amazed that we get manage to get a usable amount of power out of them after so many years.

Changing the subject did you see this item
http://www.sciencedaily.com/releases/2010/08/100826152217.htm

This effect would have a beneficial effect on very low earth orbit sats such as SO-67 and also the future ARISsat.

Hello Trevor,
Yes, very interesting.

Alexander Zaitsev, one of my aquaintances, a director at IZMIRAN, and his team are studying that
very thing with their cubesat mission.

I attach a snippet from a mail I sent to GM1SXX quite some time ago.
.....
.....

(snip) ... I've been doing some research. Izmiran's long term plan seems to be (within the current
Russian space program) to develop and use smaller and smaller rockets and consequently smaller
and smaller satellites but with more frequent launches.

As you (probably) know, Izmiran's program is similar to the Norwegian Andøy Rocket Range program -
but far more advanced - with the study of the magnetosphere, atmosphere and radio wave propagation.

It's logical to assume that they've already figured out that the cost saving can be huge by conducting the same experiments with more frequent, cheaper satellites using cubesat technology. They are in fact in
the process of implimenting this plan BUT YOU DON'T KNOW ANYTHING ABOUT IT YET ... right? ... right!.

As you know, I'm all for a ROBOT type satellite that could perform a lot of the Izmiran experiments by remote control from ground station commands ... (snip).
.....
.....

I did try to get a few prominent people interested in helping fund a 'new, improved' Amsat-ru ... since Alexander has links to the 'other' Alex - (Popkov of RS-10 fame) - but unfortunately, little interest was
shown - most people had already jumped on the 'university' bandwaggon.

I agree with K2SZH ... knowing the current launch difficulties, we need to speak to people a lot higher up
the food chain and ask them to speak to 'their' superiors.

The key is to promote what *WE* can do, that other's cant.

The word 'communication' needs to be re-thought. My 10 year old daughter can chat to anybody in the world! that has a mobile phone.

I'm trying to worm my way a little deeper into Camsat - but it's not easy. Understandably, they seem to be (so far, at least) reluctant to share information. The offer of financial contributions was politely declined -
presumably because that would imply a request to share information.

We'll just have to see how things develop.

Re SRMsat it looks like the launch schedule has slipped, it was originally planned for launch in September.

Although it's not stated I assume it's using FM with the uplink telecommand on 145 and beacon on 435.
http://srmuniv.academia.edu/ssn/Papers

It's good to see so much satellite building going on in India, I hope AMSAT-India is successful in getting their linear transponders launched in the coming years.

As i always said this "Acceptable Content" is more directed toward individual than opinions...It's just another example of AMSAT-NA mismanagement.

Acceptable Content
We embrace diversity of opinions and values. In order to preserve a constructive environment, we do insist that messages contain appropriate content and are respectful of the members and readers of the list.
All posts should include the author's first name and call sign, or full name if not currently licensed.
In general, messages for the AMSAT mailing lists should be related to amateur radio satellites. Examples of on-topic posts include:
o Announcements of general interest, including but not limited to AMSAT news, meetings, satellite availability, and DXpeditions.
o Technical discussions, including the physics of space flight, modulation techniques, satellite design, RF path loss calculations, noise figure, etc.

OBSERVATIONS FROM NORWAY. 020920102005Z

A SIMPLE (switchable) 2m & 70cm PREAMP.

The BFY90 is a low noise transistor designed for wideband preamps up to 5Ghz with a gain of 20dB and an 'acceptible' noise figure for satellite working.

You *DON'T* need a noise figure of 0.2dB ... unless you working EME and anyway the sky noise at 145Mhz is 2dB.

The BFY90 is a good choice when used as a simple 2m & 70cm preamp.

Modern gaAsFETs have lower noise figures but they're expensive and easy to 'kill'.

The veritable old BF981 dual gate mosFET is excellent on 2m but the performance falls off fairly rapidly above 200Mhz.

The bipolar BFY90 performs well on both 2m and 70cm.

To increase selectivity a little I've added a switchable series tuned circuit for each band.

The preamp is built on a small piece of brass sheet (excellent groundplane) with offcuts of PC board strips bolted to the groundeplane. The strips are divided into 'islands' with hacksaw grooves.

The 1k collector resistor is a variable trimmer to adjust the current. It should be set for about 10mA for optimun performance on your noise figure meter. What?, you don't have a noise figure meter? ... yes you do! ... you have two of them ... they're glued to the side of your head ... ears !!!!.

The 'hole' in the groundplane is for a snug fit of the BFY90 TO-72 metal can - also soldered to the groundplane, together with the case and emitter leads.

The trimmer capacitors I used were miniature PCB mounted 10pF air variable types because they were in the junquebox but cheap plastic types will be sufficient.

The enclosure is an ex: aluminium oven tray - deceased!, or as John Cleese says in The Monty Python Parrot sketch ... "is no more" ... "has met it's maker" ... "is an ex: oven tray".

There are 3 x LED's to remind me which position the switch is in. a) Through, b) 2m or c) 70cm.

Hey!, if you were as old, bald & senile (OBS) as La2qaa you'd need 3 x LED's too.

Everything else ought to be self explanitory by 'squinting'' at the circuit diagram.

Betreff: [eu-amsat] New satgates?
Gesendet: Fr, 03. Sep 2010
Von: Francisco Jiménez-Martín Sánchez

Hello all,

I□m searching for new addresses of satgates, because satgate.aprsca.net is not working in the two ports that I have, so If anybody knows more satgates, please share them on the list. I□m trying to run a satgate to gate the iss packets to the internet.

Thanks in advance,
73 de Fran EA1JM

3695. The Space Award.

Yahoo group: eu-amsat
Date: 2010-09-03 08:43:02 UTC
From: John Hackett
Topic: 3695 Message: 3695

For those amateurs interested in satellite awards, the following is probably 'right up your street'

<http://ukw.cqun.kz/award_kosmos.html>
.....
.....

THE SPACE AWARD.

Issued by the VHF Committee of the Kazakhstan Federation of Radiosport
and Amateur Radio - for communications via amateur satellite or EME.

The diploma has three categories as follows ...

Category 3.

100 two way contacts via amateur satellite. 50 for EME.

Category 2.
250 two way contacts via amateur satellite.150 for EME.

Category 1.

500 two way contacts via amateur satellite. 300 for EME.

Contacts via repeaters are not valid.

Contacts may be CW, voice or digital. Each category may be mixed or endorsed

seperately.

The diploma is numbered and is issued in paper form.

The application for the diploma with attached QSLs (eQSL acceptable), certified by two licensed radio amateurs together with 5 Euro's for Kazakhstan or 10 Euro's for foreign stations should be sent in paper form to ...

UN9GW
Igor Afanasyev
AinaBulak-1
Alma-Ata,
Kazakhstan

or ...

For applications in electronic form ...

UHF_KFRR@...
Box 239 .

Almaty.
050000 Kazakhstan

The award is valid from 01.01.2007.

.....
.....

Thanks to RW3XL for making me aware of this award.

73 John. <la2qaa@amsat.org>

Hi Fran,

looks ok. BTW, there is a good tool for control of what you want to see in UI-View. Go to M0CYP UI-View Web Resource website and look for UI Filter.

http://www.apritch.myby.co.uk/addon_uiview32.htm#uifilter

Ciao,
Mike

3703. Low power on AO-7.

Yahoo group: eu-amsat
Date: 2010-09-07 14:07:23 UTC
From: John Hackett
Topic: 3703 Message: 3703

Low power on AO-7,
RW3XL and myself enjoyed a low power contact on AO-7 this afternoon using just 2 watts at each end of the link. I had absolutely no problem copying Igor, even in less than optimum propagation conditions - Aurora to my north east ... making the signals 'watery'.

Alligators take note.

For the newcomer ... 'alligator' = all mouth and no ears.

3704. Working cross mode CW/SSB on satellites

Yahoo group: eu-amsat
Date: 2010-09-07 19:43:39 UTC
From: Terje Haug
Topic: 3704 Message: 3704

Hello Group,

I have enjoyed working cross mode via satellites, and it seems to be efficient as seen from my perspective, I am however open to views on this practice. Responding to SSB calls by CW may be regarded as unnecessary or even impolite or at least a nuisance in some cases, I can see that.

For sure you can not really know if the station will be able to respond or even want to respond to the CW call, however a clear cut response by saying “no CW please” will be/must be respected, and that is rather quickly done.
In the case of having a marginal uplink capability, it will be possible in many cases to provide a readable signal to the SSB station. My opinion is that such a QSO should be limited to callsign and report, but leaving the SSB station the choice of further exchange of information.

Such practice as describe above has by the undersigned proven efficient when working 50 MHz, QRP/P. Obviously it can generate a second or two of “changing ones listening mode” for the SSB station, however it pays off to listen in for CW, and treat that station in the same manner as an SSB station. The station calling in CW offers a chance for one more QSO to be made. The CW signal may penetrate the noise/QRM/other stations, hence a QSO can be made, which was not possible in an efficient manner in SSB

A QSO is a QSO in spite of being cross mode. Is it that simple?

Group,
I endorse LA5PBA's comments

.For the very reason Terje mentions ... (cross mode) ... as a CW aficiondo, I've always operated my downlink rig in SSB mode.

CW up, USB down.

All my QSO's with K3SZH, I8CVS, G1WPR and G7NFO (RS-10, FO-20, FO-29, AO-7, VO-52 and HO-68)
have been cross mode since about 1993 to the present day.

Most of the experienced (older) Hams have no problem using either mode.

I8CVS and myself often operated both modes on the same pass/same satellite - (FO-29)

Hello Terje

A cross-mode QSO in SSB/FM via satellite is possible with PSK31
and in phone of course. If you talk about efficiency, phone is the
most inefficient mode and PSK31 the most efficient mode I think.
If you can separate tones from a few Hertz and you can follow the
Doppler shift by ear, if you have an absolute ear like a musician
and you are a good CWist, CW could also be very efficient. I exclude
CW by computer. You will have always several signals in an FM downlink,
the tones are depending of the uplink QRG of each operator. Without
software support such a mode is very difficult to decode if not
impossible.

AO-51 with its broadband receiver is the only satellite for cross-mode
yet.

"regarded as unnecessary or even impolite"

Probably one of my best AO-40 QSOs was hearing TA1D on AO-40 at 8 degrees elevation through the ground clutter using a single 20 turn S-band helix three meters off the ground. He called CQ in SSB. thinking my SSB signal would be unreadable, I used CW. He returned to me in CW with the elevation getting even lower. That QSL card sure looks great on the wall.

It was necessary and I didn't think impolite.

All the best,

Mike K9QHO, Elwood, Indiana USA

3709. Bandpass filters for 2M and 70cm..?

Yahoo group: eu-amsat
Date: 2010-09-09 16:33:12 UTC
From: LA2MOA
Topic: 3709 Message: 3709

Hi group!

Did some major rearrangements in the shack in order to get room for

a)My computers, and
b)Myself

The solution was quite simply to let the FT-726R go, it's quite simply just TOO BIG for my minimalistic shack. I have two FT-817NB rigs, which are more than capable to works all the satellites which are in orbit. The 817 has a wonderful receiver also on 2M and 70cm.

However, today I discovered that I get terrible interference on the 70cm rig when I'm transmitting on 2 metres with the other twin... Furthermore, I'll get the same interference when I'm transmitting on 70cm and listen with the other rig on 2 metres. Well, I can understand that I get problems with the third multiple from 145 MHz when I'm listening on 70cm, what I don't understand is that I get the same problems when I'm listening on 2 metres and transmits on 70...

Well, instead of digging too deep into the cause of the problem, I'm trying to focus on a solution. Aha! Filters...

So, does anyone here have any ideas of a good design for home-brewed bandpass filters (or highpass filters for 70 and lowpassfilters for 145) that I can use. I'm quite sure that I'm not the first one experiencing this kind of problems, it should be quite common when running full duplex with two radios. Or..?

73's all!

Hans / LA2MOA

3710. Re: Bandpass filters for 2M and 70cm..?

Hi Hans,

Try..
http://www.amsat.org/amsat/articles/w6shp/jfilter.html
for 70Cms.

If you can find one, the old Pye Telecoms 70Cms filters are also pretty good. They will easily tune to the 70Cms amateur bands and can sometimes be found on Ebay or in fleam markets. The model I have is Cat No AE450 F It tunes 380-520Mhz with very small insertion loss.

For 2M, things get a little bigger. Capacitor tuned helical filters are common on this band. Suggest you consult the usual oracles such as the ARRL and RSGB books. I've also seen beer keg filters used to very good effect on 2M.... but you want to SAVE space, not fill it up :-)

Privet Hans,
Have a squint at EU Amsat / Photos / La2qaa / Dupleer - (enlarge the pic to see the details).

If that doesn't work, make a pair of stripline filters ... *SHOUT* if you need details.

Hello Hans

Before you build any filters check out your coax cables and connectors. If
the cables doesn't run in right angles near the antennas or they are
entangled
this can also produce interferences, especially if you turn your rotator.

Hi Thomas!

Thanks for your tips! You're completely right, when I'm transmitting in cartain directions, the interference is completely gone! Well, the cables are laying on the roof, but I will try to split them apart a bit. Maybe that helps.

Thanks also to John for the tip regarding the home brew cavitys for 145 and 435.

73!

> > Well, instead of digging too deep into the cause of the problem, I'm trying to focus on a solution. Aha! Filters...
> >
> > So, does anyone here have any ideas of a good design for home-brewed bandpass filters (or highpass filters for 70 and lowpassfilters for 145) that I can use. I'm quite sure that

I'm not the first one experiencing this kind of problems, it should be quite common when running full duplex with two radios. Or..?

3716. Confessions of a traitor!.

Yahoo group: eu-amsat
Date: 2010-09-14 18:05:11 UTC
From: John Hackett
Topic: 3716 Message: 3716

Hello Al,
I have a *TERRIBLE* confession to make. In 44 years of radio, the last 20 of em' exclusively
on CW/SSB satellite ... I just made my very first FM QSO.

YESSSSSSSS !!!, I know! ... I ought to be hung, drawn and quartered then tied to a drum of burning oil
before being hung by the neck until dead at 08:00Z with my eyes being pecked out by the Ravens at the
Tower Of London.

Actally, it was mistake! - (that's my excuse and I'm sticking to it) - I was faffing about with MixW, WISP and
UISS at the beginning of the pass when I heard one of my Russian mates so I grabbed the mic and threw out
a quick 'privet' - whereby Nikolay responded immediately ... before the belam started.

Point to ponder.

Oddly enough, the Telenor digital TV decode is *NOT* affected when I point the aerial south - I'm still trying
to figure this one out ...

I'm CC'ing the to the reflector so that Jow Public can see that La2qaa can fall off the soapbox too.

73 John. <la2qaa@...>

I think you are in a process of successful ageing John on at least the item 6 "hobbies" criteria.
I cannot evaluate the other ones;)

Successful ageing consists of three components:

1. Low probability of disease or disability;
2. High cognitive and physical function capacity;
3. Active engagement with life.

A greater number of people self-report successful ageing than those that strictly meet these criteria.

Six suggested dimensions of successful ageing include:

1. No physical disability over the age of 75 as rated by a physician;
2. Good subjective health assessment (i.e. good self-ratings of one's health);
3. Length of undisabled life;
4. Good mental health;
5. Objective social support;
6. Self-rated life satisfaction in eight domains, namely marriage, income-related work, children, friendship and social contacts, hobbies, community service activities, religion and recreation/sports.

Good one! Luc,
You're one of those North Americans who appreciate and understand the Manchester humour - a very rare bird (pardon the pun) indeed.

Always a pleasure mon ami.

Hello Nader,

I was able to download some parts of the directory, I enclose a screenshot, this is my first time that I download the directory of a pacsat with wisp, and I□m a completely newbie! , I was able to upload a message to John, LA2QAA, I hope he will read it tomorrow!

I□m learning how to use wisp, and there are many things I don□t know, but download the directory was terrible due to the voice activity over Europe.

73 de EA1JM, Fran.

PS.- Tomorrow, if I can, I□ll leave you a message on HO-68!

Pacsat forever!

3721. Digital on HO-68.

Yahoo group: eu-amsat
Date: 2010-09-15 08:41:19 UTC
From: John Hackett
Topic: 3721 Message: 3721

Hello Francisco,
Nice to know you. I noticed your comment to Nader about uploading a message to HO-68 for me. Unfortunately, I won't be able to copy it ... not just yet anyway.

I've been operating radio for 42 years - the last 20 of them on satellite but yesterday was my very first time on FM (!) ... so in this mode I'm a complete newbie too. I'm still setting up WISP myself. I think Nader is the 'digital' expert.

Also, I live on Frei island with no local Hams so I have to teach myself everything.

Perhaps you could send the uploaded message by e-mail Francisco - at least until I get myself on digital mode.

Really good to know somebody else is available for getting to know (for us) a new system.

I operate the HO-68 blog <http://www.observations.biz/XW-1_BLOG/> as well as EU AMSAT so if we can manage to hook up I'll put it on the blog. I'll be listening this evening Francisco - but unfortunately, only on FM voice, until I get the digital side active.

I'm also the local area coordinator for HO-68 but the communications between Camsat and the amateur community could be a 'LOT* better and more frequent ... but HO-68 is a wonderful satellite for a LEO bird.

Have a good day Francisco.

73 John. <la2qaa@...>

3722. More power Egon ... MORE !!!! power ...

Yahoo group: eu-amsat
Date: 2010-09-15 19:25:54 UTC
From: John Hackett
Topic: 3722 Message: 3722

I've been operating and monitoring HO-68 in it's FM mode for the last few days.

It's clear that 75% of each workable pass is wasted or unusable, in that stations are just QRM'ing eachother.

It ought to be obvious, but apparently isn't, when the satellite is transmitting a packet burst, an FM voice perator is *NOT* going to get into the transponer - likewise, when someone is actually 'using' the transponder to speak to another station on voice it's a complete waste of time to send a packet stream.

What is obviosly happening far too often is that stations are QRM'ing eachother so that station A in frustration
turns up the power while station B responds - thinking this is the only way to defeat station A.

Heads up !!! ... nobody !!!! is going to get through like that - unless of course station C comes on with *RIDICULOUS* power levels and 'captures' the transponder with sheer force (FM capture effect) as happened this evening (I won't mention the callsign) ... and for the record, I'd stopped attempting to transmit 10 minutes previously so I can assure you it's *NOT* a case of 'sour grapes' on my part.

Think about it ... 75% of the pass unusable because of *AMATEUR* QRM.

It's sad that such a wonderful satellite is 75% unoperable because of atrocious operating proceedure.

I'll leave it to the 'powers that be' to discuss the reasons why this happens..

73 John. <la2qaa@...>

3723. A suggestion.

Yahoo group: eu-amsat

From: John Hackett
Topic: 1646 Message: 3723
Attachments: 1 described; binary payloads are missing from this source WARC

Group,
A suggestion - for when HO-68 is in digital mode.

Perhaps we could get a few more operators to use the free 'UISS' program for UI packet operation.

You *CAN* send small messages in APRS format as well as being able to see where the stations are
located, on APRS.FI - with Google earth type maps.

3725. Take a deep breath ...

Yahoo group: eu-amsat
Date: 2010-09-16 18:57:36 UTC
From: John Hackett
Topic: 3725 Message: 3725

Group,
I just worked Romania, The Czech Republic, France/M, Spain and the UK on the last HO-68 pass
WITHOUT ever calling CQ.

Any QRP'er worth his salts will tell you about the technique of 'tail-ending' - (or you can Google it).

'Timing' is everything.

Another tip is to take a deep breath before you speak ... (to allow the relays to switch over) ... many
operators forget that - and end up doubling, trippling or even quadrupling - (Google 'FM capture effect' too).

FM *DOES* work if everybody uses a bit of common sense.

My best advice ... relax !!! and don't get frustrated.

NB.

I *DID'NT* 'hog' the satellite. YO9GHX was the only station I called, the other stations called me at varying times throughout the pass.

Thanks to YO9GJX, OK1DNT, F5JSD/M, EA1SAL and G7SVF. Nice operating, Gents.

73 John. <la2qaa@...>

John,

Nice to hear that you're back on FM! FM is indeed a very nice and relaxing mode if everyone onthe sat is adapting one simple thing: Common sense.

I have changed rigs here, as you maybe know. My FT-726R was too big for my shack, and I first planned to replace it with a TR-751E and another good rig for 432 MHz. Now the FT-726R, which was too big, is replaced... With a Kenwood TS-790E(!)... Too big, he said (meaningly)... Yeah, the TS-790E is slightly smaller than the FT-726... haha... And, My God, WHAT A RECEIVER!!! I wish my two sons (6 and 5 years old) had just as good ears as the 790 - then true harmony had been a common state in the QTH, I can tell you...

However, the TS-790E lacks possibility to transmit the subtone necessary to access HO-68 in FM, so I have to stick with AO-51 if I want to work in the Friendl Mode (as FM is defined in, in the ARRL Operating Manual). Yesteray, I had a very nice QSO with UA9UIZ in NO46ec via AO-51. AO-51 is, just as HO-68, a very capable satellite - which allows some very nice DX-QSO:s if everyone adapts the rule of common sense and stops shouting on top of each other. Then, FM becomes a fun mode to work.

Hans / LA2MOA

Cu all on HO-68 (linear mode) next week.

Topic: 3725 Message: 3727

Hello Hans,
TS-790E? ... smaller? ... hrm! ... must be *AT LEAST *!!!! 2mm smaller.

I'm just jealous !!!!.

Yes, I lied! ... I did have one FM QSO about 12 years ago on AO-27 but thye operating was quite! different then, people wern''t climbing on top of eachother ... that has only come with the powers that be giving Ham licenses away in Cornflakes packets at the lopcal supermarket. (tick-box) mentality.

You have to remember, it's ILLEGAL in the European Union to think for yourself or show initiative ...
a define no! ... no!.

THUD !!.

(Falls off soapbox).

Personally, I can't understand why people are having so much difficulty. I'm gettin through with a minimalistic station and low power. OK, Frei Island *MAY* have something to do with it.

BTW ... I operated AM and FM in the military so I'm not 'new' to the mode. Only 'new' on satellite FM,
which is fine for geosyncronous orbits 1 to 1 ... but is *NOT* very sensible for a LEO over a crowded
continent. Well done! Amsat.

I do think they've realised that they shot themselves in the foot ... but there's no way in the world !!!!
they're going to admit it ... they could well be NOGS !!!!.

Hello John - and every owner of a TS790E,

of course your TS790 E can send CTCSS tones with just a small modification (see mods.dk).
The backdraw is that you loose the 1750Hz tone (for repeaters mainly in Germany).
I made the mod an also installed the decoder board for CTCSS and have a Kenwood Mic with DTMF tones AND the 1750Hz tone in the mic ;-).

So just a small modification and a great step for sats requiring subtones.

3729. RE: LA2MOA's TS-790E.

Yahoo group: eu-amsat
Date: 2010-09-18 16:01:31 UTC
From: John Hackett
Topic: 3725 Message: 3729

John, DL5RDI,
I believe your post was meant for Hans LA2MOE.

I was merely commenting on his recently aquired TS-790E. My own satellite rigs are Yaesu and
are almost 30 years old. I do have a TR-851E but for AO-7's uplink or HO-68's downlink it doesn't
require tones. I've never operated AO-51 and don't intend to start now. If I did need tones
I'd use my IC-E92D ... which I use for APRStt and DTMF comms, as well as GPS and D-Star etc.

I'm sure Hans will appreciate your tip.

I've been a member of the Mods DK website for many years.

73 John. <la2qaa@...>

From: LA2MOA
Topic: 3730 Message: 3730

...and I'm sorry for that. Just had a very surprising QSO with TK4LS, Laurent, on FO-29. Was calling CQ on what I beleived was a "underpopulated" and more or less activity-free passage, and BANG - a new DXCC on sat as well as a new #. Really nice, indeed.

I also noticed that the latest trend among lids is to transmit FM on linear transponders. This time it was a russian, belarusian or ukrainian goon that shared his way of having fun with everybody else on FO-29.

Ham Radio - it takes all kinds...

Hello Al,
I just worked UN7IU, SV2KGA, F0FIG, SP5MG and HB9DLI on the 17:39 UTC HO-68 pass.

I didn't call CQ but used the 'tail-end' technique - (1.7 second relay switching pause) - at various
parts of the pass.

I must be doing 'something' right ...

Captain's log.

Stardate 200920102026Z,

To whom it may concern,
Further to my post re: working different stations on AO-7 vis-a-vis HO-68.

I worked 22 seperate countries on HO-68 in one week *WITHOUT* calling CQ.

They were ...

LX, IK, 9A2, HB, F0, SQ, SP, SV, UN7, EA3, YL2, G7, UK1, YO9, RA4, PA3, SM7, UN9, DF7, HA6, ON4, OZ1.

I'd need to go back to the heady days of 1982 20m RTTY from Gossen island, to compare with that.

NB. ... Not one single CQ call.

Think I'll try for the 'KOCMOC' award I mentioned in a previous post. The Chow Mein eaters might be
interested in the performance of their 'baby'.

Did I mention I was using an 'Arrow' uplink (3 elements) and a homebrew downlink (6 elements).
No preamp - (not needed on HO-68) - the prpverbial wet piece of string is adequate on this satellite -
or failing that, a rusty six inch nail stuffed in a PL-259 coax connector.

Attention GM1SXX.

... Hey !!!, and that's *WITHOUT* !!!! apple crumble and parsnip soup.

Take us to warp four Mister Crusher ... make it so!.

Hello Mike,
20 years ago I would have been against using an actual callsign to illustrate poor operating
proceedure ... BUT TIMES HAVE CHANGED.

Since the main organisations appear to shy away from their responsibility of teaching good operating
proceedure and downgrade the standard - in the disguise of 'education' ... it must be up to the experienced operators to lead the way ... ie teach by example.

As you correctly point out, a good operator could have had a QSO in the time it took to groan
- Ole, ole, ole ... there's no need to test equipment on the satellite transponder... the local repeater?.

There is also a mine of information on the net describing how to work FM LEO's ... common sense! is the
keyword ... but unfortunately, today''s society seems to be primarily composed of the me first!!! mentality.

I completely endorse your post Mike, as an illustration of how 'NOT* to behave on a satellite.

No reply necessary.

Quite impressive but that's something we doesn't have here in NA. There is time we can have a lot of stations calling but not to a point to
step over each other during an entire pass.

The polite way to explain this is the number of stations far exceeding the NA activity level and the other way is numerous stations are
very undiciplined on the satellite lets say very bad satellite operator?. Could be a mix of both too.

Could be the numerous commenting about the right way to operate on satellite does not get to some of theses station probably because they
are mostly written in english not in their own language?

Couple of years ago i was visiting the Menton/Vintimille area and i was able to hear the same Zoo on some local VHF repeater. Each part of
the world have their own ways could be at the bottom line it is the european way? But i could be wrong here and please correct me if it is
the case.

John et al,

I totally agree with you .. When only one channel is available, a good operating technique and discipline are indispensable.

At this point, once and once again, a few basic thoughts about operating techniques:

o The first and golden rule-first listen, then send!

o Don't call during on-going QSOs or call CQ-wait, even when it's hard to resist.

o Whistling, tapping, "hello, ooola", and so on is superfluous-on an FM transponder, extra sounds are unnecessary.

o Reduce output to a minimum-an overloaded transponder helps no one

o Keep the QSOs short and essential. Here there is a difference of opinion-is it necessary to send the grid square? During an HF contest, such a report would be a valid QSO. In Europe, we've developed this style-but isn't it more effective to work in contest mode? When the satellite was quite busy-callsign and signal report-that was it. Name, QTH or even the station equipment can be exchanged when one is truly alone on the transponder.

o Practice discipline, limiting yourself to one QSO each pass-during those precious minutes, everybody has a turn. I often sat there with my microphone in my hand and never had a single QSO.

o There will always be stations which will be annoying (due to their operating style)-it is, however, senseless to interfere with these stations-it doesn't help anyone else.

o We respect QSOs in different languages. It actually works with suitable discipline and short QSOs-a pass is often multilingual and listening in can be lots of fun.

Perhaps we shouldn't get caught up with the "daily chaos" and try through our own operating techniques to show a bit more discipline. It's difficult, but we should try it-even when the finger on the microphone key is itching, the output regulator isn't doing anything and when one's eyes are rolling when the name or location is repeated for the third time.

Maybe we can succeed, then, if we use the existing FM satellites that way, just like it's been long been successfully done over existing SSB

transponders. With XW-1, we have the chance to work other continents in FM.

73, Mike

John (and Mike DK3WN),

Exactly my thoughts...

I don't feel a bit sorry for myself about the lost 9H and new DXCC. There will be plenty of oppurtunities to work 9H on sats, and it's also good to konow that there is at least one 9H-station QRV on satellite. What I feel is that this kind of operational behaviour is just soooooooooooo totally unnecessary. It was not a pile-up "20 meter style", and there was no more that five or six stations QRV on AO-27 at that time. The FM-voice window was about 5 minutes long, which means that there was plenty of time for everyone to work eachother - IF THEY JUST BOTHERED TO LISTEN INSTEAD OF SHOUT!!!!

Anyway, I've got my new DXCC today. Just worked LX2LA on both VO-52 and FO-29... New # and new DXCC. Thanks, André! ;))

3748. ... and now for something completely different ... (Monty Python)

Yahoo group: eu-amsat
Date: 2010-09-21 22:23:01 UTC
From: John Hackett
Topic: 3748 Message: 3748

No ... not sport ... THE GOOD NEWS.

On this evening's pass of HO-68 - (210920101854Z) - I actually heard a couple of stations have 1 QSO
then keep quiet. No need to name the callsigns, they know who they bare.

Mike's DK3WN suggested operating proceedure is the best thing since fried bread and if we *ALL* follow his advice ... 1 x QSO and then let somebody else! have a go.

I agree with his suggestion, the 'locator' is redundant. If necessary, it can be found on QRZ.COM so his suggestion of *ONLY* callsign and signal report *IS* valid.

Hust to balance out the GOOD operating on this evenings pass there was also one particular station calling and calling and calling ... and calling !! ... CQ SATELLIT ... on top of strations who were already in QSO.

... err ... FM transponder ... capture effect ... one-at-a-time ...

BELIEVE !!!! me ... it *IS* an advantage having a receiver tuned to the correct frequency. If you don't understand doppler effect - Google it ... likewise ... "Operating FM satellites".

Good one! Mike.

Hello John

Since a few months, after an update of QRZ.COM, the details are only available with a login. This is curious, so I have edited my "Details" into "Biography". Look @ http://www.qrz.com/db/HB9SKA

Note to this discussion: Take it easy. Every satellite is circling the earth and is coming again, and again ... again ... :-)

From: John Hackett
Topic: 3752 Message: 3752

Hello Al,
As you know, I agree 100%. The 'communication' seems to have disappeared, not to speak of the experimentation ... but perhaps we *CAN* still utilise the ''self training' aspect of the hobby ... to become
better operators.

Having said that, I concur with Mike that FM satellites are only suitable for 'contest'' type operation -
(as I've attempted to show this last 10 days). As Mike (IMHO) correctly stated, the locator in such
short exchanges is redundant.

Rather than 'whinge' and acheave nothing at all, I decided to *attempt* to do something about the operating proceedure problematic by teaching by example. I may *STILL* acheave nothing - but at least I'll have tried.

CC'd to the group for general interest.

73 John. <la2qaa@...>

3753. Silly me !!! ...

Yahoo group: eu-amsat
Date: 2010-09-22 19:08:55 UTC
From: John Hackett
Topic: 3753 Message: 3753

Silly me !!!. I'd always assumed full duplex meant that everybody could hear everybpdy else on a
transponder like HO-68 in FM mode ... but it appears that F0FIG has a different interpretation - since he was calling 'CQ satellite' on top of UN7IU who was speaking to SP8CGR ... whom, with his very strong signal continued to call CQ throughout most of the pass - effectively blocking the satellite for any other users.

... and on that subject, here's a bit of common sense from Hal ZS6WB - (with a comment from LA2QAA)
followed by a PS from Hal.

.....

Hi John

Here's some food for thought!

A valid QSO is one where callsigns and a previously unknown piece of information is exchanged. Generally this is the signal report but the signal report is not required.

More and more satellite operators are chasing grid squares for VUCC and other operating awards. In the U.S. there are almost daily grid activations from grids other than the home grid listed in QRZ.COM and the same will happen in Europe. As an example, ND9M recently took a holiday and activated 79 different grids and he is on another one of those trips in the western U.S. right now.

Suggestion ... (assuming contest style operating).

Why not drop the signal report and exchange only grid squares so you know where the other station is for sure. The four digit square is all that is required and then you are sure you have his real location.

If I were a well-disciplined satellite operator I wouldn't call anyone unless I heard a grid locator that I needed and I would then call that particular station with a quick exchange of grids to complete the QSO.

10 to 15 seconds per QSO and a lot more efficient as you only call the grids you need - (hopefully).

We've recently updated our VHF contest rules and the contest exchange is now defined as "an exchange of callsigns and six-digit grid locator with signal reports optional, but not required.".

What are your thoughts on this?

73 - Hal ZS6WB

.....
.....

Comment from LA2QAA.

Snip ...

In fact, I'd like to put the following post on the reflector VERBATUM ... (as is, to you!) ... as a 'suggestion' to guage the reaction of some of the experienced operators ... but of course I won't do that without your permission.

I think it's an excellent idea 'as is' but would suggest a recommended maximum of 3 x contacts throughoutthe pass - (*NOT* !!! necessarily consequative contacts) - this, to help alleviate the tendency of the 'impatient' stations ... (whom may get bored and start with their ... CQ CQ CQ CQ CQ CQ CQ CQ CQ CQ) ... thereby making a pig's ear of the system.

HO-68 is a great satellite in that it caters for various types of operator/mode. My own personal opinion is that it's the best one we've got. On par with RS-10 regarding sensitive receivers with the DX opportunities of FO-20.
.....
.....

The three QSO
limit sounds reasonable but some common sense should be used. If a rare portable
DX station is on and it may be the only pass available then he should have
priority.and fixed stations could be picked up another time. A good example
might be a /MM station in a rare "wet" square. They are a lot of
fun, by the way.

73
- Hal
.....
.....

It would be nice to get some feedback regarding the above suggestion.

Please note that the above is a *SUGGESTION* ... and *NOT* a recommendation endorsed by CAMSAT
so there's no need to get your knickers in a twist if you don't agree with it.

From: Luc Leblanc
Topic: 3754 Message: 3754

Is it possible to have AO-51 configure to pass DSTAR signal as AO-27 does? With autumn first day today we will have more time inside
available and it could be an interesting experiment. On V/U fm mode DSTAR signal does not pass through as a previous test made last year.

3756. How *DO* you get through to them ???

Yahoo group: eu-amsat
Date: 2010-09-26 19:55:10 UTC
From: John Hackett
Topic: 3756 Message: 3756

The operating on this evenings passes of HO-68 was absolutely atrocious!.

There was obviously a 'competition' between the Russian CQ SATELLITE, CQ SATELLITE, CQ SATELLITE
who didn't hear the stations replying to him ... competing withAWWWLER ... AWWWLER ... AWWWLER ...
(switched to USB, surprise !!!, an Italian) both co0mpeti8ng with the ... "I'm *ONLY* using 100 watts"
station.

On HO-68 you could use 50 watts to a wet sock! and still communicate.

The beacon is 200mW !!! and most people hear that OK. I often have QSO's using 200Mw so there really
is no need for being an ALLIGATOR with 100 watts.

Several times on both passes I was 'STOMPED* on by stations calling CQ *WITHOUT* asking if the frequency was in use. Had they listened !!!! before transmitting they'd have heard it *WAS* in use ... but who actually listens !!!! these days?.

Operating QRP really *HAS* become a challenge on satellites this last few years but it's not the propagation that is the main problem, it's the extreemly poor habits, manners and standard of operating brought in by the
FM era.

You expect! this kind of operating from FM afficiondos - many have never been taught the art of operating properly - and now, several are bringing these habits to the linear satellites.

MINE'S BIGGER THAN YOURS !!!! ...

MORE POWER EGON ... MORE POWER ... MORE POWER !!! ...

73 John. <la2qaa@...>

Thud !!!!

(Falls off soapbox).

ALLIGATOR = all mouth and no ears.

How *DO* you get through to them ???

Dear John ,
You need a Russian tube amplifier and EME array antenna!!

ALLIGATOR = all mouth and no ears.
ALLIGATOR = Big mouth ,small ears.
ALLIGATOR = 1000 watts with dummy load antenna.
ALLIGATOR = 100 watts with closed SQL.
ALLIGATOR = big lizard.
ALLIGATOR = giant reptiles.

Good DX OM

While it's true that you find - 'the same old faces' - on AO-7, IMHO the general standard of operating
is better on AO-7 than on HO-68 ... which is a pity because HO-68 is a wonderful satellite.

One notable exception is one particular French station who persists with deliberate QRM when he doesn't
get an answer ... after transmitting on top of another station.

OK !!! ... my QRP *IS* weak ... but you *CAN* hear it if you actually *LISTEN* before transmitting.

Another problem scenario is the differing 'convention' for doppler tuning ... and before ya'll start
quoting the 'one true rule' - not everybody has a flashy new computer and rig with automatic doppler correction available. As it's always been, some people interpret manual tuning one way - others a different way.

With an orbit like AO-7's doppler should *NOT* be a problem whichever! convention you use - but that of
course requires common sense.

With one particular station this morningy, on almost every transmission the callsign changed ... a common mistake, from certain people trying to be "clever" - by transmitting faster than they're capable of - thereby sending a *LOT* of errors.

Those tactics belong on 20m - not on AO-7 or HO-68. The ARRL recommends not answering such stations,
just leave them to their endless CQ's ... when they don't get an answer but hear QSO's going on all around them, they *MIGHT* eventually get the message ... (yes, we can hear you but choose not to answer poor
operating) ... but don't hold your breath while you're waiting.

TIP.

Slow down - so that the 'errors' in your callsign are reduced by 50%.

Believe it or not, a slower, correctly sent callsign is more efficient and is transmitted faster than one that's
transmitted with erors and needs to be repeated repeated ... again
.....and again.

The common sense department ... a CW net can only operate at the speed of the slowest operator.

The fastest is almost always *NOT* the best ... the reason is more often than not - "Look at me" ...
(read: a lack of confidence/wants to be 'noticed').

The two usual reasons a station doesn't answer are ...

1) They can't hear you.

2)They chooses not to.

Deliberately calling CQ on top of a station that doesn't answer you really is childish.
It'd *MUCH* more sensible to go and find somebody who *WILL* answer you.

Dear John and all

UISS work with digipeater satellite and ISS to relay back the UI packet frames . But HO-68 is not a digipeater satellite ,HO-68 mode is PACSAT Broadcast Protocol. Only WisP or an old DOS program PB.exe and PG.exe work on the PACSAT Broadcast Protocol .

Good Luck OM

3761. ND9M Road Trip Update

Yahoo group: eu-amsat
Date: 2010-09-23 09:50:25 UTC
From: John Hackett
Topic: 3761 Message: 3761

Hello Hal, ZS6WB,
As far as I know, the only serious grid square chasers in Europe are the meteor scatter crowd and the terrestial VHF/UHF/MICROWAVE opperators.

I don't think the vast majority of LEO satellite users are even aware of the concept like it's performed
Stateside or /MM by VQ9.

Perhaps somebody should write and submit a grid square "How to" for the group.

(I'm too lazy!).

73 John. <la2qaa@...>

3762. From the soapbox ...

Yahoo group: eu-amsat
Date: 2010-10-01 16:36:16 UTC
From: John Hackett
Topic: 3762 Message: 3762

two rants from the soapbox today ...

1)

It would be nice if somebody could whisper in IK8YSS''s ear that filling in the AO-7 log for next Friday
(05.10.2010), today, the 02.10.2010 at 07:53 makes a mockery of the log statistics.

He can edit and correct his own entry by clicking on the spyglass at the left of the screen, make sure! the
'remember me' box is checked on the NEW CONTACT page.

2) The *GENTLEMAN* attempting to QRM my QRP on the last AO-7 pass probably heard ... you didn't do
it did you. FYI Sir ... a repetitive 'faster than you're capable of' will *NEVER* drown out a clean transmitted
QRP signal without errors ... as 9A2EY and EA3GP can attest to.

I've been at this game for over 40 years son and I can assure you, operators like you are 10 a penny.
Was I irritated? ... absolutely not ... just amused. QRP''ers are quite used to deaf people.

There !!! ... now you've had your moment of glory.

73 John. <la2qaa@...>

3763. Monday the 4th.

Yahoo group: eu-amsat

Topic: 3764 Message: 3764

Hello Nader,
That was a good one.

I'm glad somebody can see my tongue-in-cheek humour.

By the way, Nader, I copied you the other day on HO-68 using the UISSpacket program.

I've set up WISP and MixW with the VSPE program as you recommended. Everything seems to work
OK but I havn't used it on HO-68 yet. I'm still setting up the UISS program for satellite APRS messages.

I havn't done any digital satellite stuff since the old PSK-1 stuff on LO-19 and PB and PG on UO-22 so I'm
having to learn all over again. I forgot everything ... and the older you get, the harder it is to learn.

Interesting !! though ...

Attachments: 1 described; binary payloads are missing from this source WARC

For those just getting started in satellite communications the attached pdf file, while quite old now,
is probably the best 'introduction' to FM satellite communications.

Unfortunately, the pdf is no longer available for download because the originator's account is suspended.

Perhaps someone could open the pdf and add it to the group's file department.

Why don''t I do it? ....

Because I'm as thick as two short planks on a computer and don't know my arse from my elbow ...
(but at least I'm honest).

Luckily, I kept a copy of this file when I first came across it a few years ago ... in those days I was *TOTALLY* against FM as a non-military satellite mode over populated areas.

I'll *NEVER* need this file ... (in)famous last words.

Newcomers are advisesd to swot (read up on) correct operating proceedure - which can be summed up in
three words ...

1) listen
2) listen
3) listen

... and as a PS ... keep your power down.

50 watts effective radiated power really is too much on a LEO ... that's 50w to an omnidirectional aerial,
5 watts to a 10dB gain aerial ... (TAKE INTO ACCOUNT FEEDLINE LOSSES) ... or any permutation in
between that will produce a maximum of 50w EIRP.

Some stations are running twice! that - but are pretending they're not ... *DON'T* become one of these
clowns. Operating skill is *FAR* !!!! more effective than power. Don't help to shorten the satellite's life
by knocking it silly with ridiculous amounts of power.

Please use some common sense, regardless of which satellite you use.

Try to remember, it's a shared resource ... don't *HOG* it. A good operator makes 1 x QSO and lets somebody else have a turn.

Group,
I had my second ever AO-51 QSO at 15:07Z today with RW3XL.

One QSO and let somebody else have a go.

I decided to try the 16:43 pass too ... utter chaos!, with not one but several! stations calling on top of eachother.

Is it mandatory to *NOT* !!! listen on FM ???.

What is! the point of calling CQ satellite (a 'well known' G station) while two other stations are already in
QSO ???. Then there was the "/P" station with the strogest signal in the passband (think about it) - not to
speak of the AWWWWWLER ... AWWWWWWWLER ... AWWWWWWWWWLER (water buffalo with stomach ulcers ??) station.

That particular QRM was of course quite deliberate because nobody !!! takes that long to find their downlink ... unless of course they *DON'T* !!!! have a receiver.

Ohh well, it did remind me why I stay well away from AO-51.

A tip for the newcomer. You should try to emulate (copy) RW3XL ... at least then you'll be operating properly.

For the record ...

I've been operating for 44 years so when I say "my 2nd AO-51 QSO", that's quite disparate with the word 'newbie' ... (atrocious! American term).

I stay well from AO-51 by choice ... not by lack of experience.

My first satellite QSO in 1984. My first FM satellite was UO-14, somewhere around 1991 I think.
People didn't trample on top of eachother so much in those days but it *DID* happen . and always will, by
it's very nature ... capture effect etc ...

Another tip for the newcomer ... just because *YOU* can't hear the satellite (assuming you're listening on the correct doppler adjusted frequency) doesn''t necessarily mean other people can't ... so if you can't hear
the other stations (there are *ALWAYS* !!!! other stations) you're either on the wrong frequency - or - your
receiving system isn't good enough ... IN WHICH CASE YOU SHOULDN'T TRANSMIT.

It isn't illegal to operate with 100 watts to a 10 element beam from your shack and say you''re QRP/P ...
but it ought! to be.

3771. An opinion.

Yahoo group: eu-amsat
Date: 2010-10-04 17:38:25 UTC
From: John Hackett
Topic: 3771 Message: 3771

I still think HO-68 has a receiver every bit as sensitive as RS-10 had.

I have no problem whatsoever with my QRP ... even in competition with the packet racket ... this time
to a log periodic ELK - (as opposed to the usual Arrow aerial).

There are in fact certain stations on HO-68 who actually listen !!!! ... (yes, I'm amazed too).

My apologies to RW3XL, he thought he was dreaming! earlier today ... LA2QAA on AO-51 ... (his words).

For the newcomer ... La2qaa operates from FREI ISLAND, IOTA-EU-36. JP33WB on late afternoon/early evening GMT passes. I'm QRP so 'ears' *ARE* mandatory. I usually tail-end the good operators.

Luc,
Thanks for the TF heads up.

Personally, I finished with 'DX' (worked them all) many years ago but the newer operators may be interested
in a new one on satellite.

If 'wallpaper' was money my name would be Hefner, not Hackett.

I stopped sending in cards for diplomas when I ran out of wall space ... anno 1990.

Highly amusing! on AO-51 today - some would say bordering on the ridiculous ... one /M station managed
to get through the alligator chaos ... and wouldn't you know ... suddenly, everybody! was mobile ... he he he.

It's fun squeezing 1 watt (to an ELK) between these power mongers. Hurgen, DG0ER, thanks for listening.

Also amusing listening to 3 stations all talking at the same time ... remind me again, what does full duplex mean? ... rather like the old 'pile-up' days on 20m in the 80's sunspot maximum.

When I lived on Gossen Island I was chased off the IOTA frequency by a chappie in Milan (!) with ... "Get off
the frequency!, it's for IOTA stations only" ... so not listening isn't something new. BTW, I did used to sign as
LA2QAA/QRP IOTA 36 ... and was 'told off' by the Milan station for not giving the "correct IOTA designation".

Of course ... an LA IOTA station could have been in the South Atlantic or perhaps The West Indies, yes?.

Hi John

I cannot help you with your wall space but i can help with wallpaper i got a collection from Ekstra Bladet side 9 from your neighbouring
Dennmark it will probably make some change on your walls... On the morning pass it was a pleasure to work also in a very orderly manner
N1ABA, W6GMT, KM9U, KG4CBC, KE3LB, i probably missed one or two other too but the traffic on AO-51 was very disciplined contrasting with
what i heard from EU. On a 12 minutes pass we cannot engaged a long chat but it is at least a good way to see if our satellite equipment is
still working.

Just to let you know that FO-29 is actually giving common footprint between Northern Europe and North America (me...) i will try to listen
today on the 2002Z pass and a much better one on 2145Z if you or other EU station want to try an North Atlantic satellite jump that's the
time to go for it.

3775. The WAIIR award.

Yahoo group: eu-amsat
Date: 2010-10-05 17:32:52 UTC
From: John Hackett
Topic: 3775 Message: 3775

To anybody interested ...
I just worked UN9GW in Kazakhstan again on HO-68 ... now I only need 3 more
for my W.A.I.I.R. award ... (Worked All Igor's In Russia Award) ... having already logged
RW3XL, UA9CS
UN9GW, UY5LW, UL3USD and UA9CCL ... (all of whom have Igor as their christian name).

I strongly suspect I'll get the coveted award number one.

This time, I was running QRO (!) with 2w on FM ... (to get past the 100w alligators) ... on
my IC-E92D.

I read on the E92 reflector that you can't work satellites with it because it's not full
duplex ... admittedly,
I only managed 24 countries in 10 days with my Arrow aerial and 2 watts so I can't really
say I agree with
the gentleman who posted that tripe.

My IC-E92D has the most *FANTASTIC* facility for satellite operating. IF YOU DON'Y PRESS
THE PTT, YOU CAN ACTUALLY HEAR !!!! THE TRANSPONDER ... honest !!!, I'm *NOT* kidding.

Wouldn't it be great if they made *ALL* amateur transceivers with a 'RECEIVER' in them.

... but why stop there ... one could add an *ON* switch to one's ears.

Hello Luc,
I believe !!! you.

A few years ago, Emily N1DID, formerly W0EEC of the AO-7 Resource Page fame, and I were hooked
up on Echolink while she was working AO-51 over the bay Area (Los Angeles). The standard of operating
was far! higher than that which can be heard over Europe.

Hal, ZS6WB assures me that's the case over South Africa too. I don't know why the European operators
operate as they do ... impatence?, lack of experience?, non-understanding of FM? ... one would think that
when listening to three or four stations transmitting at the same time.

One of the interesting challenges is trying to work AO-51 using a remote base station. The one in Australia even allows you to control the rotor down there from your computer on the internet. You have to remember
to check the keps for passes over Australia !!!.

I often operated the one in the USA, just to say I''d tried it.

For anyone wanting to try their luck, just Google VK3UR and apply for a password.

Europe has a far higher population density. Western/Central US and Southern Africa are very sparely populated and have far fewer users within the satellite footprint.

It's down to the basic fact that single channel systems don't work in areas of high demand.

Thomas,
I agree with you, the 'density' of the population has absolutely nothing to do with the 'quality' of
the operating proceedure.

Not to speak of the quality (or lack of) the amateur examinations these days in the UK ... where an 'instructor' is asked to mark a paper as *WRONG* if the student answers 'cycles per second', to the
question of how radio waves are measured ... (just ask GM1SXX).

It's called splitting hairs and serves no useful purpose whatsoever.

Since the accepted 'international' language is English - and radio waves are 'measured' in cycles it would
be logical to assume the correct term would be cycles per second ... as it was on all !!! radio equipment in the English language previously.

NB.

GM1SXX teaches the students the "CORRECT" term but also points out the answer the examining body require for a 'correct' answer.

Beurocratic pillocks!.

Quite the little zoo on the two AO-51 late afternoon passes over Europe again today.

Everything from the pregnant moo cows to the whistler.

I discovered a new way to make working AO-51 more difficult, today.

One particular station with a G as the last letter of his callsign suffix tried Golf, Georgia, and Guatemala on
succssive CQ's ... and actually managed to confuse himself (!) ... so I assume any potential newcomers
may have also been confused ... not that they'd get past the /M station with an aerial similar to the one in the attached pic ...

Yesss it *DOES*happen ... making it harder for the genuine mobile stations ... ditto some of the so-called
QRP (?) stations ... I'm *ONLY* running 100 watts.

Mine's bigger than yours !!! ...

More power Egon! ... more power !!!! ...

Awwwwwwwwwwwwwwwwwlllllllleerrrr

Neither riducule, education nor appealing to common sense is going to get these clowns to dissist so do like
the Signals manual says ... work through it ... (in this context, the operative word being ... 'ignore').

To whom it may concern,
Another 'tip' when working the FM satellites.

It does *NOT* help by giving your callsign 4 times. We all know you're trying to slot in between overs ...
but all tou're doing is creating even more QRM.

Only the alligators can get away with this proceedure.

A short, sharp, crisp clear transmission with your callsign once! is sufficient. That's what people are listening for, more than that and you're QRM'ing somebody else. *TIMING* is the key.

At least 75% of the last pass was QRM.

I wondered at first if this post was a joke... but then again, perhaps not.

I'm only posting this reply because the use of bad operating manners and excessive uplink power is so prevalent in Europe with FM birds.

The answers.
Well, for FM birds, probably nothing. FM is FM. On or off. Two states.

For linear birds, excessive power depletes the battery which is very bad. A 'no-brainer' as our friends from thye US would say.

What 'works' for the FM birds...gross bad behaviour, excessive power etc, kills linear birds. That fact is worth remembering.
Then consider whether even launching FM birds is a worthwhile exercise.

Read about the purpose of the beacon. If you don't know why, read the books. Not many people appear to bother reading these days. If you don't have any books, go buy some. You don't *have* to buy the books from AMSAT but if you do, I'd suggest 'The Satellite Experimenters handbook' (ancient but good). For more serious study, try SMAD. Satellite Mission Analysis and Design, although this is not aimed at amateur satellites, and is not only about power budgets and batteries, but about the design of satellite missions generally.

I hope that helps.

Hello Nader

It was Martti Laine, OH2BH, who "created" this phrase. Look for
him here: http://everything2.com/title/DXers%253A+masters+of+lightning

I thought every OM worldwide knows this phrase, it was meant
sarcastic of course. :-)

I think John understood my sarcasm, he has also his special humour. :-)

Apropos humour in mails: http://en.wikipedia.org/wiki/Smiley

3791. Explanation time ...

Yahoo group: eu-amsat
Date: 2010-10-07 07:35:25 UTC
From: John Hackett
Topic: 3791 Message: 3791

Folks,
Thomas is right, and yes, of course I understood his tongur-in-cheek humourous comment as satirical - (sarcastic but without offence). Thomas obviously understands my humour.

The explain the phrase "More Power Egon" ... it's from the 1950's movie called FRANKENSTEIN where the mad doctor is attempting to get life into Frankenstein by using 'lightning' to increase the power.

When used in the context that I mentioned, it's to ridicule the excessive use of power.

Are more serious explanatiuon is thus ...

On a linear transponder, the power is distributed among the the users ... more users = less power to each.
One station using too much power on the uplink is drawing more than his fair share of current in the transponder. This can clearly be seen on AO-7 when the satellite, without battery back-up often has little chance to recover after certain orbits (read: not enough sunlight to sustain heavy use).

I'm not an expert on FM transponders, there are better qualified people than I in this group, but I assume
too much power is also detremental on these satellites too, possibly shortening their life ?? ... but of course,
the purportrators will just say ... "it wasn't me" ... "It was the other fellow" ... just like the 100w, 10 element
MOBILE stations ... "Oh well, it must have been the propagation" ... (good excuse).

THUD !!!!

(Falls off soapbox).

Hello to the group,

The best line I read in the above text is " Our computers allow us to communicate daily to others all over the globe with reliability unmatched in amateur radio." This is what all my non-ham friends tell me!! :-)

Now, on to my point.

I do not operate satellites (I do not have the equipment yet) , but I am watching the group and learn a lot regarding operating procedures - as well as the bad habbits some operators have (and I feel shamed that some of those are Greek).

Unfortunately, as you know, even if you publicly refer to their names and callsign for improper behaviour, this will not change anything as they simply do not care to follow rules and procedures as much as they do not care about the others and "sharing" is not known to them, even when this is not about something they own, such as the satellite frequencies. I am sure these guys demonstrate the same antisocial behaviour everywhere, at any band.

Do you think that a guy using 5000W ERP will care if the satellite will die because of his habbit? I dont think so, as he just does not care and maybe he is quite stupid to understand it, or his IQ does not allow him to understand anything more than "I connect a transceiver to an antenna and I can talk.Just to be sure anyone can hear me, let's use a 500W amp".

I personally give a lot of responsibility for this situation to the local ham radio clubs and associations who should spend more time training people on any aspect of ham radio than anything else. They could do some serious seminars on operating techniques to let the ignorant operators know that not all methods of communication were made equal and that each one has its own peculiarities.

Would it be outside the spirit of ham radio to report the abusing at some regulator authorities, from where it would reach the operator himself with some serious notice that "if this improper behaviour continues your license may be revoked" ?

...is probably the most ignorant statement I've ever heard. Sarcastic or not, the statement is darned close to classic stupidity. In the middle of the 90:s I heard a 9K2-station who was running FOUR (yes, 4) KILOWATTS. OUTPUT!! on 20 meters.. I remember him saying "I don't care about antennas or propagation". No. Right. So get yourself a darned good telephone subscription, then. Or?

If this hobbys main topic had been "100% stabile communication with anyone at any time", it had most likely been forbidden by ALL governments in the world.

No. I like to turn Mr Laines cracknut statement upside-down by saying "The World is Too Small For QRO!"

Just my five cents,

Hans / LA2MOA

Nick,
... and anyone else interested.

It's quite obvious that my attempt to shake up awareness of the 'power' problem have obviously worked
and a 'debate' has been created - (which was my intention).

While I agree that appealinmg to common sense for the alligor operators is a waste of time ... who cares!
if I help to ruin the satellite, I'll just move on to the next victim ... it will make the good operators more awar4e of *NOT* falling into the habits of the alligotor types.

I don't know whether you're aware of it Nick but one of your countrymen and a personal friend of mine,
was the other original founder of this group together with myself and GM1SXX ... That was of course
Makis SV1BSX (SK) ... to whom this group is dedicated.

... and for the record ... I have *NOT* heard a poor operator from Hellas (Greece) and most certainly
NOT those elmered by Mak.

For the newcomer ... a reduction in power by 3dB (half) is almost not even noticable! on a meter.

The important criteria is *NOT* PA ... (as in power amplifier) ... it's PE !!! ...(as in PROPAGATION and
EARS).

Privet Igor,
That was the best signal I've ever heard on AO-51.

As you well know I don't operate that satellite very much but I have monitored it since it's launch.

I wish everybody operated like you.

Why don't you invite some more of your Russian friends to join us in EU AMSAT, they'd be *VERY* welcome.

Poka! Igor.

It could also be a catch 22 as i often worked stations with very limited receiving setup and in a way to get through the end of an exchange
i often have to increased my FT-847 0 fully conterclockwise power level to a good 25 watts and sometimes more than that as the other end of
the line nothing seems to worked without a lot of power. On an FM satellite it's not too hurting but on linear bird it is as it produce a
cascading effect but how politely telling someone his setup is less than marginal on the receiving side at least?

It's like telling a women she's intelligent but ugly at the same time...or vice versa

3798. Circular v linear polarisation ... again.

Yahoo group: eu-amsat
Date: 2010-10-07 17:35:11 UTC
From: John Hackett
Topic: 3783 Message: 3798

Hello Luc,
Agreed! ... and I can confidently speak for GM1SXX too ... we've discussed exactly that point many! times. I did use circular polarisation at the beginning of my 'satellite' career but with experience, found it to be *NOT* necessary.

In my opinion, the occasional loss of 3dB due to a polarisation mismatch is *NOT* the catastrophe certain people claim. I agree with you, it's hardly worth the effort though I do understand those stations that strive for utopia (he means 'perfection', folks).

At my last QTH I used a circularly polarised array - but hardly ever bothered to switch it to circular, these days, at my present QTH I can only manage a rusty 6 inch nail (vertically polarised Elk) on a TV rotor but I still managed 24 countries in 10 days using low power on HO-68. That tells me that circular polarisation is most definately*NOT* a necesssity - sometimes an advantage ... but like you say, "is it worth it?".

As most operators know, much depends on the propagation, the orbit, HEO v LEO etc ... one point the newcomer to satellite operating often overlooks is the fact that the signal is passing through the ionosphere twice! - and the propagation conditions can be quite different between stations that are only 1000 - 2000 kilometers apart.

The 'linear' system has the advantage of providing a 'reasonable' signal whatever !!!! the polarisation of the incoming signal. Another thing the newcomer often doesn't realise is that even if a satellite *IS** propagating a circularly polarised signal, unless it's propagated by a quadrifilar helix aerial the signal that is
NOT along the boresight will *NOT* be circularly polarised, but elliptical at a certain degree.

(NB. 'electrical' degree). Signal strength play a role here ... but that's *NOT* an excuse for smacking the satellite with ridiculous amounts of power.

The potential newcomer should concentrate on SKILL as opposed to sheer power.

I'm fully awatr tyhat *YOU* are perfectly aware of all this Luc, most Amsat Area Coordinators are ... my remarks are aimed at those who are just getting their feet wet.

Hello

I agree with you Gentmen 3dB not a big deal on FM birds. (I think so!!)
But on digital mode and during the handshake between the satellite BBS
and my PC I'm using a changeable polarization homebrew antenna. This helps sooo much. and prevent the losing of the contact on many passes of the HO-68 recently and on GO-32 and AO-51 BBS before.
I was just watching the S meter and flipping between deferent polarization position to keep on steady downlink signal.

Good luck Gentlemen

Hi Henk,

it was a pleasure to listen the HO-68 pass at ~1950 UTC on your ham-webradio link. You know, I'm just sitting here in my lonely hotel room in Bonn without any radio.
Thanks for your great efforts and trying a short QSO practice. But you learned this evening (again) - Europe needs the full locator ;-) for a QSO grrrr... Keep on this good practice and thanks a lot for your great job.

Talk to you soon.
73, Mike

Betreff: [amsat-bb] HO-68 FM live audiostream also on today (Oct 7th)

Also today (Oct 7) the HO-68 FM live audio stream will be running all day:
http://www.pa3guo.com/webradio.html

You will hear noise when the satellite is not overhead my station (JO21RJ, Netherlands, Europe).

Last night there was quite some (very disciplined) activity with many countries present.

Henk, PA3GUO
The Netherlands

Point taken Nader,
In digital communications, particularly Packet, or anything without forward error correction, an acknowledement is all important and the human ear + brain can't insert a missing element
like it can in a plain text message.

Therefore, a digital signal must be received without error, to be decoded correctly ... and a 3dB degraded signal sometimes can't manage that.

I explain this merely as a point of reference for any newcomer following this exchange of information.

But they have no other country with a large Amateur population for thousands of kilometers around them. Also we don't hear what Japan sounds like on short-wave when you're close up, just a single hop away so I'd be wary of judging all Japanese ops by the few with QRO stations and big antennas that we hear in Europe.

The reason the same chaos can occur on shortwave is down the capacity limits - a band can only take so many operators - in contests that capacity is exceeded.

Single channel FM satellite systems can work fine as long as there's only 5 or 6 operators in the sat footprint wanting to use it, go above that and it breaks down. Which is why we need higher capacity satellites using linear transponders.

FM sats can be great for demonstrations but are of no use for serious communications.

Hi Trevor

Looks so logic .

Let's do some math!

Pass duration 15 min (a good pass)
QSO time 2 min (on an average +/-)
So the total number of QSOs 15/2 = 7 QSO/pass

Now if any of the station would like to work the other 6 stations
we need 6+5+4+3+2+1= 21 QSO/pass ????

Hi John,
I do know that Makis was one of the founder of this group, but unfortunately I did not have the opportunity to know him but I have heard and read so much about him that I wish I had.
You know, this discussion has triggered my curiosity so much that I am seriously thinking of getting some equipment and watch a few passes of the satellites to hear myself how it does sound! Who knows, maybe in spite of the chaos, it is challenging enough to consider operating the satellites!
Hope to hear you first, and work you then through the satellites!

FB Nick,
I hope you do get some equipment, Remember !, it does *NOT* have to be very sophisticated or expensive to get started. Anyold dual bander or 2 x separate rigs will do for the FM satellites. It's
NOT necessary with full diup0les - though it *IS* an advantage.

On the linear satellites I use a 28 year old FT-290, which works very well ... so you *DON'T* need the latest all-singing, all-dancing dedicated 'satellite' gear. Just use whatever you can lay your hands on, to begin with.

73 John.

Hi John,

I do know that Makis was one of the founder of this group, but unfortunately I did not have the opportunity to know him but I have heard and read so much about him that I wish I had.

You know, this discussion has triggered my curiosity so much that I am seriously thinking of getting some equipment and watch a few passes of the satellites to hear myself how it does sound! Who knows, maybe in spite of the chaos, it is challenging enough to consider operating the satellites!

Hope to hear you first, and work you then through the satellites!

73,
Nick,SV1DJG

3807. Actual transmission.

Yahoo group: eu-amsat
Date: 2010-10-08 18:19:20 UTC
From: John Hackett
Topic: 3807 Message: 3807

The following is from an actual HO-68 pass this evening.

QRZ? QRZ AWWWWWWLA CQ CQ QRZ AWWLA (blow) (blow) this is Italy Zulu Seven Juliet X-ray Juliet

in south Italy QRZ? (pause for breath) - several stations answered ... QRZ? QRZ? CQ CQ satellite this is IK7JXJ

QRZ? AWWWLA CQ satellite This went on for the entire! pass with one
station UR4LRH with what I'd guess to be several hundred watts after he
didn't get a reply with a 'normal' signal the first 3 times.

(IZ7JXJ returned) Perfect! my friend, please repeat your call (the UR4 station repeated his call several times)

eventually, the Italian station got it correct - thereafter QRZ? QRZ? CQ CQ satellite ...

... for the rest of the entire! pass.

... and that my friends, is how *NOT* to do it.

The above transmission is verbatum (as it happened) from 17:42 GMT for the entire pass.

I really can't say whether the Italian station realised he blocked the transponder for the entire pass.

So much for a *SHARED* resource. I have a minimalistic aerial (Elk) but I heard several stations replying to

IZ7JXJ every time he said QRZ?.

If he was a newcomer and didn't understand that satellite operating is a bit different from the 20m

free-for-all, there may have been an excuse ... if he was an experienced operator who just decided

he was going to HOG the satellite for the entire pass, there *IS* no excuse for poor operating proceedure.

I hope somebody gives him a heads up.

There were at least !!! 20 stations who tried (unsuccessfully) to use the transponder on this pass.

From: John Hackett
Topic: 3808 Message: 3808

Very little point in trying to flog a dead horse but the 19:29 UTC HO-68 pass was ljust ike the previous
one ... absolutely chaotic.

One contest type exchange in a 15 minute pass ...

QRM reigned supreme with a couple of stations calling CQ satellite while the two stations in QSO were
actually still talking.

I don't know whether to laugh or cry - amusing and tragic at the same time ... my daughter exclaimed -
"Those !!!! are radio amateurs ???" ... (and the powers that be wonder we can't attract youth to the hobby).

Any reasonable person listening to that pass would have said ... "I'm not joining that !!! lot".

It sounded like a fox in the henhouse.

Surely !!!! it's time the National Society's took the bull by the horns?.

I'm *NOT* !!! so sure the problem is the newcomers either.

Shared resource ??? ... yea! ... right!.

Dear John

A medical advice (Yes I'm a MD).

You wll get a High blood pressure or Myocardial infarction if you keep listening to FM satellite.
Return back to Linear sat asap and relax .

:-)

Dr.Nader

Hello Nader,
Yes, You're absolutely right.

I seriously believe trained monkeys !!! would do a better job on FM satellites - at least we could teach them
to listen and *NOT* call CQ over the top of other stations already in QSO.

I always believed that to be a radio amateur one understood simple concepts like full duplex and FM capture effect ... now I'm not so sure these principles *HAVE* been grasped by quite a few operators of the FM satellites.

For the record ... I've had 4 x heart attacks and live in a 'special' old people's facility now so I *DON'T* let this anjti-social behaviour get too me, on the contrary, I find it amusing that so called ''intelligent' people
(radio amateurs) behave thus.

Like I said, I'm quite sure a flock of trained monkeys could do a better job ... and I'm *NOT* joking.

Luckily, not all operators are in the same category.

Have a good weekend Nader.

73 John. <la2qaa@...>

NB.

I keep telling my physician, I need a brain !!! transplant - not a heart transplant.

Ohhh, medicine...
How about Sat? :)
Two different situations present. First - stations, which calling us over other. I have QSO's with ES8SW, and Heldur don't calling others when some other activity have place! But, if no other station on sat He always said "Hello". IMHO it's good manner. I know other stations, which answer on my CQ more than 10 count in a day and do it in the low angle. Some times I want to swear, but I understand that, probably, it what for is necessary for them.
Problem with second situation - station calling (CQ or other station), but don't listen other. Have not ears? May be They use Simplex mode tranciever like FT-8x7 with wrong tunings? There should be any reason for transmiting and no answering. I listen record "over NA FM" and shocked. No abuse, like Communism.

FB Igor,
Nice to see a long time member making some comments.

I hope you'll encourage a few more Russian stations to make some comments on the reflector.

Tell them *NOT* to worry about the English language ... I think their English is a lot better than my Russian.

From: Mike Rupprecht
Topic: 3813 Message: 3813

All,

according Henks PA3GUO idea I will also stream the HO-68 FM transponder for test purposes this evening.

http://www.dk3wn.info/webradio.php

The times for my QTH JN49lr are:

09 Oct HO-68 17:24 to 17:39 UTC 17 deg pass

09 Oct HO-68 19:08 to 19:27 UTC 53 deg pass

09 Oct HO-68 20:56 to 21:15 UTC 41 deg pass

Any comments are very appreciated.

73, Mike

DK3WN

gentlemen Mike and Henks

Thanks you very much

Very very enjoyable to listen to the same satellite after LOS.
I heard myself with delay of 5 or 6 seconds .

If more stations from deferent location streaming the same
Satellite we could follow the sat through the globe.

This is a very practical teaching method to exchange the technique and skill among
satellite fan community.

Thanks again gentlemen

Topic: 3815 Message: 3815

The live audio streaming of FM satellites of the AO-51 and HO-68 ilk, by Henk PA3GUO and Mike DK3WN
has a *TWOFOLD* advantage for the radio amateur.

1) ... It will cut down on-air time of many American and South African satellite operators ...

(c'mon !!! ... they'll be far too busy to actually work the satellite because they'll be laughing their socks off
at the European operating).

2) ... Many Europeans will hear what they themselves sound like.

... and hopefully ... this will eventually lead to a better stanbdard of operating.

Yes, I know !!! not everybody has had professional training but 'common sense' ought not to be a commodity
one needs to learn in the same way one learns good manners ... (or *NOT*, in this particular case).

Topic: 3818 Message: 3818

The RF only chaps are going to love !!! me for this.

Immediately after the last AO-51 pass, just for laughs I QSY'd to ECHOLINK to have a play with DTMF on
my IC-E92D (the only gear I have that isn't almost 30 years old). I connected to the Russian reflector and
found myself subject to a mini pile-up - (Frei island. IOTA EU-36).

In *PRINCIPLE*, this is similar to FM with the difference that satellite ops are full duplex so you can actually
hear the chaos of the other stations climbering on top of eachother whereas Echolink isn't full duplex and you can only hear the station that is 'captured' ... (one-to-one internet connection, unless you're set up for conferencing.

Anyway ... what I noticed was that each QSO went in an orderly and well mannered fashion - a far! cry from
satellite operating in Europe. I specifically mention Europe because the operating is *NOT* this bad in other parts of the world, regardless of population density.

... and before ya'll start whinging ... "but it's not RF, consider this" ... when I have my IC-E92D connected to K0NS in Washington State via the internet - and then go out over one of the local repeaters on the U.S west coast, it most certainly *IS* RF ... for part of the link at least.

The advantags ...

Nobody whinging about my aerials and No QRM !!!.

... for the loser now is later to win and the times they are-a changing.
Robert Zimmerman. (Bob Dylan, to you!).

Privet Igor,
I quite agree ... in such a case it's not really wise to complain.

I don''t know if you read my last post but it was refreshing! to have a couple of QSOs on Echolink without QRM. There were stations from all over Russia and The Ukraine. I very often monitor The Russian Reflector in the 'conference' node and have a chat when someone calls me.

Quite a lot of the chaps like to practice their English and it's a good wayfor me to improve my 3 sentences
of Russian.

Menja za voort John ... and I'm *NOT* looking at a dictionary ... he he he

Topic: 3821 Message: 3821

Even though the mode has changed on HO-68 it is still *NOT* against the law to actually *LISTEN* before
You start CQ'ing ... there could be a QRP station already using the frequency and you'll making a mess !!!
stomping all over him.

Three times on the last pass stations started CQ'ing without asking if the frequency was in use.

YOU WILL NOT SHOT AT DAWN IF YOU *LISTEN* FIRST.

IT IS NOT !!! EFFEMINATE TO ASK IF THE FREQUENCY IS IN USE ... THEN *LISTEN* !!!! FOR AN ANSWER.

>

This is one of the most interesting posts I've seen to date. It highlights one area where current amateur radio training falls down very badly. I for one would like to see a couple of chapters in the RCE/RCF training manuals devoted to power levels, specific techniques for the various modes, and some teaching about what constitutes reasonable power and behaviour for the various modes, including satellites... at Foundation level.

> Would it be outside the spirit of ham radio to report the abusing at some regulator authorities, from where it would reach the operator himself with some serious notice that "if this improper behaviour continues your license may be revoked" ?
>

As for this part, it simply wont happen. We are now essentially a self-regulating hobby (at least in the UK), and in the whole of my country, Scotland) I believe the regulating body has only one investigator ..... to cover all aspects of radio communications. This in part could explain why amateur radio in particular and radio generally has so many problems. Even persistent offenders. known to the authorities. do not have their license revoked.

Hi All,

I know I am not a regular poster, however, its JOTA weekend this coming Sat/Sun and I am going to demo the satellite station again this year.. I have now setup the SSB side although not used to that side of the Wildlife park, so will be a new experience for one and all. I will be active on the normal Zoo freqs and that includes AO-27 (for which is not so much a zoo but a rather busy drive -thru) and AO51.. So if you hear my low powered station on VO-52, AO-7, FO-29 (still active?) and of course HO-68, then I would be happy to work you for the first time!

Listen out for GB0BWS (aka M0DQO) and lets see if I can get some nice 59 repeat callsign contacts!

Best regards,

Chris (M0DQO)

Privet Igor,
Glad you got the card.

Thanks for copying my QRP just now. I was using the IC-E92D to an ELK aerial with the rig on the 2w setting.

Both yourself and Juergen, DG0ER, commented on the audio quality. I was pleased about that because I read
on one of the other reflectors that this rig can't be used for operating satellites.

I managed 24 countries in 10 days with the IC-E92 so I wouldn't put too much faith in that particular opinion.

It's not full duplex but if one uses one's' EARS' it works very well indeed, without problems.

A headset and a remote microphone helps too.

In every PDF I've seen with recommendations for operating FM satellites I've read that the cardinal rule
is to have an your squelch open.

I disagree.

The signals from the FM satellites are so strong that even a *TOTALLY* deaf transceiver doesn't need to operate with the squelch open.

Personally, the hissing drives me crazy! - maybe a throwback to sitting all night on Salibury Plain with an
A41 strapped to my back.

Most of today''s modern rigs have adjustable squelch levels so if you set the squelch to level 2 or 3 (more
sensitive than 8 or 9) you can relax without the Rice Crispy sounds - (snap, crackle and pop).

... and anyway! ... do you *REALLY* think you're going to copy a *VERY* weak signal through the bedlam
that is FM operating? ...

Hello John and group

You are right. I receive with an old IC-R7000. This RX is relatively
deaf in comparison to modern rigs. I have 2 preamps connected and a
DSP loudspeaker from 'bhi'. Before I had the DSP loudspeaker connected,
I had always turned in the squelch and could also receive all satellites.
Now I have the "crispy sound" reduced with DSP and an open squelch.

Gentelmen,Group

This depends on the signals strength over a squelch threshold .
If you have a good yagi with preamp and low loss coax etc ,For sure
the signal strength wll be high (enough) to open the squelch .
Otherwise you will enjoy only the silence of night.
or you wll add more QRMing stations to the crew.

So for the simple station or newbi station my advice is (OPEN THE SQUELCH PLEASE).

3828. QRP transporder

Yahoo group: eu-amsat
Date: 2010-10-11 15:59:48 UTC
From: yo9gjx
Topic: 3828 Message: 3828

This evening at one pass of AO51 i try qrp on the second transporder with 145.880 uplink and 435.150 downlink with my DR153- 5w in Jpole and work very easy IK1RAN with his 5w in 4el. yagi then he switched to 3w and still comming with 57 despite industrial noise in band. We both call CQ without succes, while the other transporder was full of qrm and "ooooolla" in the same time. Nobody came on the second transporder (i managed to request on the first one) so conclusion is that is more fun to fight. A gang of "space Legionnaires" .....
Realy i think they were unaware that the second transporder is on so we just have LUCK. Hi

Very true Al, no UK Amateur licences have been revoked in the past 8 years.

In fact I believe the only formal action our regulator seems to have taken recently was 4 years ago when they wrote a letter to somebody asking them to stop jamming a repeater. The jamming continued unabated.

Hello Al,
I know !!!.

I worked New Zealand with 2 watts and a home brew aerial in 1980/81.

I have the QSL to prove it too.

It was a *GENUINE* 2 watts ... on a homebrewed Heathkit HW-8. (se pic)

Some of my better DX includes Botswana, Mongolia, Burma, Dahran, Gabon, Oman, Albania (rare)
Montserrat, Asxcension, Diago Garcia, Martinique, China, Tanzania, Mozambique, Malawi, Chad,
Christmas Island, Zimbabwe, Guinea, Andorra, Korea, Bangladesh, Lebanon, Uganda ... yes, I've got
the Worked All Africa confirmed.

I also worked all the old Russian republics (with an award) Worked all South America and have several DXCC's.

That's the reason I didn't get my knickers in a twist when I heard the TF station on HO-68.

CC'd to the group0 to show what you *CAN* do with QRP.

Any !!!! clown can work Europe with 100 watts and a piece of wet string.

All,

You can now listen to 3 stations via internet - ZL2BX, PA3GUO and DK3WN.

Go to my SatBlog and follow the link to Web Radio or simply click here
http://www.dk3wn.info/p/?page_id=17689

Alan (ZL2BX) in New Zealand is streaming some hours per day and you can
listen to the satellites at the other end of the world ;-)

Henk (PA3GUO) is mostly following AO-51 or HO-68 in FM.

I provide what I hear. If you follow my audio stream you can listen what I
receive momentarily. It could be any satellite from AO-7 up to the NOAA's.

We are open for any ideas. Let us know what you want to hear. Any
suggestions are very appreciated.

New stations are welcome, hihi. Let's share our receiver to the other ones.

73, Mike

3834. The AO-7 Resource Page Log.

Yahoo group: eu-amsat
Date: 2010-10-14 18:17:44 UTC
From: John Hackett
Topic: 3834 Message: 3834

To anyone who cares to listen ... the rest, brains OFF ... at ease !!.

I've just been looking at the AO-7 log.

This last year It's gone from bad to worse!.

One station managed to work a few other stations while the transponder was OFF - (according to him).

One station worked 11 other stations on a single pass ... I wonder what kind of QSO's those were? ...

That kind of operating belongs on FM (for obvious reasons), *NOT* on a linear transponder.

Maybe it's *NOT* obvious to some people ... it has to do with the passband/timing/capture effect on FM.

W0EEC (now N1DID) designed the log as an ACTIVITY log, *NOT* as a 'competition' to see who can
work the most stations ... (mentioned many! times in the last 5 years, on both reflectors.

It TOTALLY defeats the object of the log ... (also mentioned countless times).

Stations filling in consequative contacts as seperate entries (again, making false results)

Very little correction of obvious errors ... despite posts on the reflectors about how to do it. The most obvious being - delete the entry and rewrite it if you're too lazy to edit the entry properly.

In short ... a dog's dinner! ... (read: a mess).

Another good advertisment for the Radio Amateur ... where 'SLOPPY' operating and poor logging practice seem to be the key phrases these days.

Whatever happened to the pride of doing things right ??.

Probably a reflection on society ... but we'd better not go there !! ...

THUD !!! ...

(falls off soapbox).

Hans,
You're absolutely right!, I forgot about that one.

K3SZH has reported to me many times of stations 'working' him (according to the log) while he has
not been operating.

Due to certain stations operating in the ... BRAINS OFF mode ... these people have managed to make a complete shambles of what used to be a very useful resource.

I often wondered why Emily gave up on what was such a useful resource - now I understand.

I spend too much time and effort editing some ridiculous entries.

The BRAINS OFF gang have turned the log into a *points* table ... on a LINEAR transponder ...
very !!! smart.

Radio amateurs used to be known for their expertees and intelligence ...(key words: "used to be") I don't think I need to finish that sentence. The paradox is that those it applies to wouldn't understand it anyway!.

No wonder! Emily gave up on it. I have no intention of restarting to edit it.

3837. Re: The AO-7 Resource Page Log.

Yahoo group: eu-amsat
Date: 2010-10-15 12:39:44 UTC
From: LA2MOA
Topic: 3834 Message: 3837

Yup,

And this is the reason why I have now quit working AO-7 completely. I've worked around 360 QSO's on AO-7 and 74 of those (YES! SEVENTY-FOUR!!!) is with a certain station with a F2-prefix... In fact, I estimate that almost 300 of my 360 AO-7 QSO's are with 4 or maybe 5 different F-stations. You see the picture here?? It makes me sick, and it also makes satellite operating a joke.

So, until P4E or any other HEO is launched, I'm QRV on HO-68 and FO-29. Two sat's that are fun to work and with good DX-capabilities.

Right now working on my 144/432 QRP EME-project, which will be "launched" the spring 2011 if everything works out.

Ta-ta,

Hans / LA2MOA

Absolutely agree with you Hans.

I too have gone QRT from AO-7 for exactly the same reason.

Amsat themselves! must accept some of the responsibility for the fast decline in standards ... promoting
FM like they did ... teaching and encouraging all the wrong things to the newcomers.

I'm *FULLY* aware of the fact that LA2QAA will probably herafter be known as a S.O.F ...

(Sour old fart)

... but that's OK, I've worked them all anyway.

I'm going backwards !!! now, I just started working FM (!!!) with a few milliwatts (because they say it can't
be done) ... kind of makes these 100w goons look a bit silly (which is the object of the exercise). It appeals
to my somewhat twisted sense of humour extracting the urine (taking the pi*s) out of the self-proclaimed PP 'experts'.

PP? ... pompous pillocks.

QRP EME ... 100w/single yagi/WJ software ?? ... tell me more.

You probably read this on the other "controlled" BB they have to have folks running all
over the grids to sustain a minimal satellite
activity... Do you wonder why QRM is a not as bad as in EU you now know a part of the
explanation GRID chasing should be used to filled the
satellite over here. Is it a way to promote good operating skills? i let you the answer!

I already knew that we share the same vision regarding this topic, hi!

The QRP EME project, which is another topic (and completely off-topic in this forum), is nothing fancy at all.

- 4 x 7 el DK7ZB yagis for 144 (3m booms)
- 4 x 13 el DK7ZB yagis for 432 (3m booms)
- Elevation/azimuth rotation
- 250-300W on 144
- 100W on 432
- LNA's from Down East Microwave for both bands
- Sequencer from DEMI
- Low loss Ecoflex-10 for all cables and stacking harness's
- WSJT (JT65B/C)

So there you got it. I'm quite sure that the first station answering my very first CQ on the moon will be F2**...

H.

Once more into the breech ...

Again, only 1 single contest type 'QSO' (?) on the last (complete) pass of HO-68 in FM mode.

Due entirely! to stations calling on top of eachother so that *NOBODY* got through.

I wonder what it's going to take before the message eventually sinks in to some of these people?.

YOU HAVE TO LISTEN !!! ...

... and when somebody is already in QSO on the transponder, by continuing to call CQ SATELLITE ...
the *ONLY* !!!! thing you're acheaving is causing QRM so that the stations who were! lucky enough to get through the bedlam have to repeat what they were saying over ... and over ... and over again ...
thereby using far more of the transponder time than is necessary.

This *IS* caused by the stations calling CQ satellite on top of others ...

IS THIS SO HARD TO UNDERSTAND !!! ... that you're shooting yourselves !!! in the foot.

Listen ... listen ... listen ... listen ... listen ... listen ... listen ... listen ... listen ... listen ... listen ... listen

As usual, AWWWWLER was in there, contributing to the chaos - and as usual he *DIDN'T* manage a contact.
Maybe it's fun contributing to the chaos ... not my cup of tea but it takes all kinds to make a world.

Oh and by the way, the chappie with *EXTREME* power, congratualations, you finally got through, but you blocked at least 10 other stations - well done!. This just makes the situation worse.

Relax !!!! Nader - it doesn't affect my blood pressure, I find it quite amusing! ... it sounds like a fox in the henhouse.

Brilliant! advertising for amateur radio operators.

Maybe a blast of Dynamite would get the message into some of those heads ... common sense certainly doesn't work.

3845. A point to ponder ...

Yahoo group: eu-amsat
Date: 2010-10-16 13:59:47 UTC
From: John Hackett
Topic: 2967 Message: 3845

Saturday - (read: high transponder activity) - AO-51, a (measured) 2 watts to an ELK aerial.

SV2KGA, ON5NY and RW4UV all answered ny single call and we all exchanged reports.

My point? ...

All those stations using more than about 20 watts or so are merely causing QRM.

It's operating technique that counts, not the amount of power.

Endless ... CQ SATELLITE, CQ SATELLITE, CQ SATELLITE, CQ SATELLITE is in fact QRM !!!!.

It *NOT* necessary. Just say your callsign and LISTEN !!!!.

If someone is already in QSO you're *NOT* going to get through and you *WILL* cause QRM.

This post is based on the theory that if you say it often enough - it might just eventually sink in.
(It's based on the Chinese water torture) - as mentioned previously, common sense obviously doesn't work.

Topic: 3851 Message: 3853

I read this two posts on amsat-bb:

JARL says: It seems that the power budget of FO-29 is low.
We turned off the analog transmitter(JTA) to confirm it on
8:19 UTC, 14 Oct 2010. We are going to perform the next use
as follows.
16 Oct, 20:00 UTC ON, and
18 Oct, 19:55 UTC OFF
It does not limit the use of the analog system transponder,
but please do uplink with the reasonable power. We may cancel
the use depending on the status of the examination use.
Please use as low power as necessary on the uplink to complete
your communications.
JE9PEL, Mineo Wakita

JARL says: We failed to turn on a transmitter at 20:00 UTC, 16th Oct.
We inform it of the future use after 0:30 UTC on 17th.
JE9PEL, Mineo Wakita

17.10.10, 17:52, "LA2MOA" :
?

...
By the way, third day with complete silence from FO-29. Anyone knowing what has happened?
Has the sat re-entered in the atmosphere and burned?
...

Mni tnx, Igor!

FO-29 is beginning to get old... When JARL now ask us to be gentle to the bird, by running QRP-levels, I'm afraid that it will be a trigger for all the LIDS abusing AO-7 and the FM-birds to migrate to FO-29 and burn her up when eccessive power use.

Common sence will NOT help in this case. LA2QAA is more thn right, I'm afraid.

I was demonstating anafternoon AO-51 pass for some scouts ranging in age from 10 to 16.

The usual 'zoo' applied ... CQ satellite on top of stations in QSO ... sometimes 4 and 5 deep!

Seriously!.

The scouts were *NOT* impressed, with comments ranging from ...

"Sounds like a bunch of old crazy! men" ... to ...

"There's no way !!! I'm going to be a radio amateur".

Well done! 75% of the operators on this afternoon's pass.

At least you've ensured these young people *WON'T* have anything to do with amateur radio.

NB.

I'm fully awatr the QRP transponder was active especially for scouts but I wanted them to see what
the *REAL* world of modern amateur radio was like ... and boy !!! did they see it ... he he he he.

I must admit, for the first time in 30 years I was actually ashamed! to be an amateur.

Hello Luc,
Thanks for the videos. I'd seen the first one before but not the others.

There's a *LOT* of truth there.

Of course, the people responsible for the decline in the standards just bury their heads in the sand and refuse to accept there's a problem.

In my opinion, offering an FM transponder to "teach newcomers" wasn't the brightest Amsat concept
and guess what ... bææ ... bææ ... bææ ...

Mary had a little lamb, it's fleece was white as snow
And everywhere that Mary went, the lamb was sure to go

... and all the little sheep followed ...

Personally, I wonder whatever happened to the pride of doing something to the best of one's ability.

These days, we live in a 'tick' box' society where any old thing is good enough - where instead of helping
the bright one's forward - we''re pulling everybody back to the weakest link.

Just my personal opinion on amateur radio and 2010 in general.

(Please note ... I'm *NOT* asking anyone to agree or disagree - I was merely stating an opinion).

It highlights well the fundamental disadvantages of a single channel satellite, they are only of use as long as there are very few people wanting to use them.

There is no doubt that the future of amateur satellite communications lies with linear transponders and where power budgets permit the use of SDX technology which eliminates the dynamic range problem where a single high power user can take all the transponder power.

I remember how impressive the first SDX Mode B transponder demonstration was at the 2005 AMSAT-UK colloquium. A Mode S version was demonstrated the following year - http://www.southgatearc.org/news/july2006/crossband_linear_transponder.htm

This technology seemed resolve the biggest drawback to linear transponders and I'm glad to see that next year we should see a satellite deployed carrying an SDX transponders (ARISSAT). Then we'll find out how well they perform in a real-world scenario.

Good post Trevor.

After my FM operating rants I think it appropriate I *SHOUT*the following ...

OYEZ ... OYEZ ... OYEZ ... (The Town Cryer).

All credit to AMSAT-UK's FUNcube project and the linear transponder. I hope they'll publish receommended operating proceedures so than we can avoid another 'zoo' situation ... and I hope amateurs will follow the recommended proceedure.

Lets get back to the RS-10 style of operating.

Hello again Luc,
Thanks. Well I spent a long time requesting the national Society's to pring recommended operating proceedures was was TOTALLY ignored - which I found to be a disappointment ... so in one way it'sd hardly surprising the standards have declined.

I'm 'FULLY* aware that the person who stands on the soapbox calling for change, opens himself to ridicule
but somebody! needs to make people aware they're on a slippery slope ... and at my age, I can take the criticism and riducule.

It it makes just one (1) operator put his brain in the 'ON' position when operating FM on a satellite - it will have been worth it.

ROGER ... ROGER ... ROGER ... I COPY YOU 100% ... PLEASE REPEAT YOUR CALL ... QRZ ?? ...

(It is *NOT* illegal to use your own !!!! national language ... but you'll get more contacts in English).

From: LA2MOA
Topic: 3865 Message: 3865

I wish (for their own sake) that all these "CQ-Beacons" operating on the birds would bother to listen for som time... then they just migh work something nice, eventually get a new callsign or a new grid in their logs, instead of working the same stations (i.e other CQ-beacons). I've changed my operating style quite a bit, and I'm not calling CQ theses days as much as i did before. Today I was listening to a passage of VO-52 and found UT1FG/MM calling CQ. Reports was exchanged and a new satellite-square was added to my collection. OK, JO57 is maybe not the most rare square to eork, but it's good to know that there is a station QRV on the birds, capable of giving you all those "all-water-squares". i will most definetely keep on listening for UT1FG/MM. Tomorrow he might be in one of those all water ones...

The lesson learned? Well, if I had been calling CQ during the whole passage, I hade never learned that there was a /MM station QRV, capable of giving me those really rare ones...

LISTEN - LISTEN - LISTEN!!!

Topic: 3866 Message: 3866

I'm GOBSMACKED !!! ... (amazed) ... could it be that the "listen" message is finally starting to sink in ??.

Like Mulder & Scully - I'll believe it when I see it.

... but LA2MOE is right, if he'd been yattering! CQ instead of listening, he'd never heard the /MM station.

An interesting fact is that the operation was published on the Amsat-bb 14 days ago and Yuri has been calling on both AO-51 and and HO-68 but is being drowned out by the .. CQ SATELLITE CQ SATELLITE ... crowd calling on top of him. Usually there are two or three stations who *DO* answer - but they can't get through the ...
CQ SATELLITE ... CQ SATELLITE ...

In the old days, the Americans used to say ... "You can't work em' if you can't hear em' ... very true.

NB.

When I mentioned I worked 24 countries on HO-68 last month (max 2w) I never called CQ one single time.

From: WILLIAMS M
Topic: 3851 Message: 3867

K9CIS has been forwarding his routine decodes of FO-29's beacon signal at 435.795 MHz to JE9PEL, Mineo Wakita.

It might be FO-29's status has been monitored more closely than in the past. This shut down seems to initiated from ground control.

It seems in past shut downs, FO-29 shut itself down when its battery state became severe. This resulted in long term battery reconditioning by ground control.

This is my favorite satellite. I enjoy having CW QSOs down to LOS. Loss of this one will greatly influence my sat activity.

I wish JARL all the best. FO-20 and 29 sure made getting my sat station up and running worth the time and effort.

My opinion,

Mike, K9QHO, Elwood, Indiana, USA

Earlier today, on the Amsat-bb a Mr Chris Bloy, a Brit ... an M station (I didn't register the whole callsign)
was asking about switchable circular polarisation but more intriguingly mentioned that he was having trouble working LEO's on 70cm with his 19 element aerial.

Well Sir, I can assure you that circular polarisation is *NOT* the problem. The problem is uncoubtedly your beam has a far !!! too narrow horizontal and vertical beamwidth for tracking LEO's. 19 elements would be suitable for a satellite in high earth orbit but *NOT* LEO.

A stiff breeze or a rattle of the rotor and you'd miss the satellite completely. For LEO's you'd be wasting your money investing in switchable circular polarisation.

I would respectfully suggest you read up on horizontal and vertical beamwith for your aerialof choice.
6 elements is about average for LEO working and certainly no more than 10 ... and that's assuming you have
a *PRECISE* tracking system.

GOOGLE is your friend.

Perhaps some G station reading this could giove Mr Bloy a heads-up.

From: John Hackett
Topic: 3868 Message: 3872

Hello Chris,
Forgive me!, I didn't realise you were here ... if I had a grain of sense! I would have, since
I'm the founder and one of the moderators of this group ... the other being GM1SXX, the intelligent one.
(I'm the good looking one) we're 'collectively' known as "The Twisted Pair" ... and we're not talking about lamp leads ... but I digress ...

I can tell you from experience that the Wimo aerials - (only insects and Americans have antenas) - are very well constructed (typical German) and for LEO linear satellites you can't beat the 6 element crossed
yagi which has exactly the same performance as 2 x 6 elements driven in parallel.

The horizontaland vertical beamwidths is 60 degrees which, in plain English means 60 degrees 'off' the boresight of the aerial your power will only have fallen to -3dB (half) ... which is as near perfect as you're going to get with an ordinary aerial for LEO use.

You only need a circularly polarised signal if there is a *LOT* of fading and Farraday rotation. Remember,
with circular polarisation a worst case scenario (cross polarisation) means a loss of 20 - 30 dB in general
(I won't go into the other aspects unless you specifically ask) wheras a worst case linear polarisation is only 3dB.

I used a 6 element WIMO crossed yagi fed as a single linear polarised aerial in conjunction with a homebrew 6 element 70cm beam with 20 watts RF fed to the aerials. I had absolutely no problems working any of the satellites from RS-10 to today's HO-68 (HEO's AO-10 and 13 included). These aerials ensured I held 3rd place on AO-7 until I migrated to other things.

the 24 countries in 10 days on HO-68 recently was with a mere 2 watts to a 5 element ELK log periodic array
WITHOUT calling CQ but using an old QRP technique of 'search and pounce' or 'tail-ending' a QSO.
The 'trick' is to learn ther timing of the changeover relay - something 75% of the operators get wrong.

Use circular by all means Chris but ask yourself ... is it really worth the time and effort?. I don't think it is on a LEO.

I stated that a circularly polarised signal is only circular in the boresight of the beam ... one gentleman forwarded the statement that a quadrifilar helical aerial is circularly polarised in all directions ... true! ...
and wouldn't it be nive if anateur satellites had them ... but they don't ... so it's hardly relavant.

The point is ... amateur satellites that transmit a circularly polarised signal do it at their venith ... in all other directions, the signal will be elliptically polarised and

linear is the better all round choice.

Of course, at *CERTAIN* times you *WILL* be at the zenith - then you'll gain the odd dB in relation to a linear system ... but we're back to the question of - is it worth the effort?.

On HO-68 you can get on very well with a rusty 6" nail or a piece of wet string. If the want to increase the
radiation resistance ... strap 6 x Coca Cola cans together (old Royal Signals trick).

Hope that helps Chris.

Hi John,

No problems, I am just willing to learn unlike some others I dare to mention!

So, if I ask stupid question, please forgive me! Anyway, so should I go for the WiMo Crossed 70cms aerial and fed it with two x feeders and connect the radio end to an aerial switch for switching the two planes rather than the phasing harness?

Would this help with the fading etc?

Any websites for research/explaining?

Chris

I'm the founder and one of the moderators of this group ... the other being GM1SXX, the intelligent one.
(I'm the good looking one) we're 'collectively' known as "The Twisted Pair" ... and we're not talking about lamp leads ... but I digress ...

I can tell you from experience that the Wimo aerials - (only insects and Americans have antenas) - are very well constructed (typical German) and for LEO linear satellites you can't beat the 6 element crossed yagi which has exactly the same performance as 2 x 6 elements driven in parallel.

The horizontaland vertical beamwidths is 60 degrees which, in plain English means 60 degrees 'off' the boresight of the aerial your power will only have fallen to -3dB (half) ... which is as near perfect as you're going to get with an ordinary aerial for LEO use.

You only need a circularly polarised signal if there is a *LOT* of fading and Farraday rotation. Remember,
with circular polarisation a worst case scenario (cross polarisation) means a loss of 20 - 30 dB in general
(I won't go into the other aspects unless you specifically ask) wheras a worst case linear polarisation is only 3dB.

I used a 6 element WIMO crossed yagi fed as a single linear polarised aerial in conjunction with a homebrew 6 element 70cm beam with 20 watts RF fed to the aerials. I had absolutely no problems working any of the satellites from RS-10 to today's HO-68 (HEO's AO-10 and 13 included). These aerials ensured I held 3rd place on AO-7 until I migrated to other things.

the 24 countries in 10 days on HO-68 recently was with a mere 2 watts to a 5 element ELK log periodic array
WITHOUT calling CQ but using an old QRP technique of 'search and pounce' or 'tail-ending' a QSO.
The 'trick' is to learn ther timing of the changeover relay - something 75% of the operators get wrong.

Use circular by all means Chris but ask yourself ... is it really worth the time and effort?. I don't think it is on a LEO.

I stated that a circularly polarised signal is only circular in the boresight of the beam ... one gentleman forwarded the statement that a quadrifilar helical aerial is circularly polarised in all directions ... true! ...
and wouldn't it be nive if anateur satellites had them ... but they don't ... so it's hardly relavant.

The point is ... amateur satellites that transmit a circularly polarised signal do it at their venith ... in all other directions, the signal will be elliptically polarised and linear is the better all round choice.

Of course, at *CERTAIN* times you *WILL* be at the zenith - then you'll gain the odd dB in relation to a linear system ... but we're back to the question of - is it worth the effort?.

On HO-68 you can get on very well with a rusty 6" nail or a piece of wet string. If the want to increase the
radiation resistance ... strap 6 x Coca Cola cans together (old Royal Signals trick).

Hope that helps Chris.

Hi John,

I'm here!!

Thanks for the info! Should of asked here first before shouting at the wider audience!! Anyway I am going to move to a smaller beam now and can this makes complete sense from what I am hearing on the linear!

I am afraid I took advise from a (how do you put it John!) more power then ears station who recommend the monster!!

Thanks for the advice on upgrading to the better antenna, Ie the WiMo as advised by those who use Linear satellites and not just the shoutsats! Fm work perfectly just couldn't hear my own signal on the linears!!!

Earlier today, on the Amsat-bb a Mr Chris Bloy, a Brit ... an M station (I didn't register the whole callsign)
was asking about switchable circular polarisation but more intriguingly mentioned that he was having trouble working LEO's on 70cm with his 19 element aerial.

Well Sir, I can assure you that circular polarisation is *NOT* the problem. The problem is uncoubtedly your beam has a far !!! too narrow horizontal and vertical beamwidth for tracking LEO's. 19 elements would be suitable for a satellite in high earth orbit but *NOT* LEO.

A stiff breeze or a rattle of the rotor and you'd miss the satellite completely. For LEO's you'd be wasting your money investing in switchable circular polarisation.

I would respectfully suggest you read up on horizontal and vertical beamwith for your aerialof choice.
6 elements is about average for LEO working and certainly no more than 10 ... and that's assuming you have
a *PRECISE* tracking system.

GOOGLE is your friend.

Perhaps some G station reading this could giove Mr Bloy a heads-up.

Hello Chris,
First off, there are! no stupid questions ... only PP's (pompous pillocks) who think they know
it all. You wouldn't believe! the cock-ups I've created throughout the years ... the 'trick' is not to make the same mistake twice.

I'll tell you what 'I'd' do. I'd purchase the Wimo 70cm crossed yagi and make a polarisation switch myself.
(You'll find one in the archives in the group) or you can Google something like *POLARISATION SWITCH*
all you need is an electrical quarter wavelength of 93 ohm coax and a half-decent switch.

You can operate it remotely if you want to keep line losses to a minimum.

Be aware that even with circular polarisation you *WILL* get some fading - depending on the orientation of the spacecrafts aerials at any given moment. Hoogle FARADAY ROTATION.

Finally, I repeat what I started with. There *ARE* no silly questions ... ask away.

There's a *LOT* of competance in this group (reason 2 of why I started it) ... just ask !!.

Hi John, No problems, I am just willing to learn unlike some others I dare to mention! So, if I ask stupid question, please forgive me! Anyway, so should I go for the WiMo Crossed 70cms aerial and fed it with two x feeders and connect the radio end to an aerial switch for switching the two planes rather than the phasing harness? Would this help with the fading etc? Any websites for research/explaining? Chris From: eu-amsat@yahoogroups.com [mailto:eu-amsat@yahoogroups.com] On Behalf Of John Hackett

Hello John

This is the reason why I listen first to the beacon before I go on
the transponder or repeater. LISTEN... ;-)

I'm glad to repeat it:

```
Call ID ID Ch1 Ch2
-------------------
BJ1SA XW XW AAA TTT -> only beacon
BJ1SA XW XW TTT TTA -> beacon + Lineartransponder
BJ1SA XW XW TTT TAT -> beacon + FM-Repeater
BJ1SA XW XW TTT ATT -> beacon + Software Upload
```

QSL John

I also can't read morse code by ear. I let do the decoding by my PK-232.
There are also many morse-code software for the sound card in the internet.

"wild east?" hi hi
On AO27 the most qrm is from spanish fishermens. I heard what they talk. The phones are comming from south, posssible from Africa, when the bird is out of range no more qrm. In my location 26 meridian the most qrm is from south. Also, on AO51 on west passes is a strong unmodulated carrier on qrp transporder, 145.880 uplink, also on AO27 i heard one time an arabic religiouse song. The most clean birds are SO50, SO67 and HO68 because of CTCSS

With a 3DB difference if you don't have the right polarization as vertical to horizontal and (vice versa) circular to vertical or horizonthal or (vice versa)
it will nor produce any significant effect in the actual satellite fleet INHO. But using left circular to right circular or (vice versa) it will give you much more
losses up to a point it will seriously impact you system performance.

If you want to work extremely weak signal as EME matching the polarization will be a key factor but not on the actual LEO sat.

I tell you this considering your planned station but those running QRP with hand held will see the difference to be off polarized as they
used antennas with minimal gain.

That's why you can see QRP'ers always twisting their antennas up to a point to develop not a tennis elbow but an Arrow wrist.

As this video show's

http://www.youtube.com/watch?v=NDAmTz5lBJY&feature=related

P.S. It is not the best demo video to present to a crowd even if W5IU (i guess) was probably making all he can to get at least on contact
but for a newbie in my shack (when i was watching the video) he told me why they don't shut off the vacuum cleaner running near him...
Not too sure if this video will even make him a future Ham! He's on MSN chatting and playing games with friends all over the world.

It will not even with a morse key that i will be able to make him leaving his MSN chat. This just hit me in the face how can we make those
young folks interested in Ham radio? I just realized he probably look at ham radio as i look to a VHF casette!!! Who cares?

Folks,
Luc is right!.

As a long time QRP'er and satellite operator I can go good for his statements. On LEO's, running CP
(circular polarisation) is 'splitting hairs' and really not worth the effort.

Using CP when running QRP *CAN* give you a slight advantage - but not much.

Do remember these two points ...

Polarisation changes when reflected - (in my case, large mountains) - and - a transmitted amateur
satellite signal traverses the ionosphere twice! ... (with everything that entails).

Google Mak's SV1BSX excellent polarisation webpages for a better understanding of polarisation.

3893. More on circular polarisation.

Yahoo group: eu-amsat
Date: 2010-10-21 11:44:34 UTC
From: John Hackett
Topic: 3893 Message: 3893

Group,
I see the polarisation issue on the Amsat-bb is being beaten to death ... again!.

This time, the delay/phasing line seems to be causing the confusion.

FACT.

YOU DON'T HAVE TO USE A PHASING LINE TO ACHEAVE CIRCULAR POLARISATION.

You can mount the aerials - (antennnas if you're an insect, or American) - an electrical quarter wavelength
one in front of the other - with appropriate counterwights to keep an even torque on your rotor.

Depending which polarisation is the leading one (in ELECRICAL degrees) will decide ehether you have LHCP or RHCP.

On AO-51 different transponders use different polarisation. See my earlier remarks about cross polarisation
vis-a-vis linear polarisation.

Be aware! ... circular polarisation on an LEO under normal circumstances is a waste of time and money.
It's only good for the boast - "Mine''s bigger than yours!" - if you're only interested in 'communicating' ...
forget it!.

73 John. <la2qaa@...>

But these satellites are also the least useful because you don't know when they are being blocked by unlicenced transmissions.

I appreciate there may be good reasons for using CTCSS due to a satellites power budget but such satellites tell us nothing about the abuse of the Amateur Radio frequencies in various parts of the world.

Where power budget allows satellites should avoid using CTCSS. An open system allows the Amateur community to monitor illegal use of our frequencies in various parts of the world.

Hello Trevor

I see you are on the same line as Drew Glasbrenner is. I don't think this satellites are the least useful ones because of CTCSS.

SO-50 has lost its stabilization since a long time. Alas there are no informations available from Saudi Arabia. But I think this is the reason.

SO-67 was too less activated to analyse anything. There was also many errors on the satellite.

HO-68 not successful because of CTCSS ? Sorry, that's rubbish.

I'm QRV every weekend and hear QRM only via AO-27 and AO-51. I agree with Florian. If the repeater has an intelligent constructed CTCSS squelch, then it blocks the QRM effectively. It could be, that the CTCSS-squelch in AO-51 is a misconstruction and that's the reason, why Mr Glasbrenner don't switch it on. I had a discussion with him about this. It's not our primary task to find intruders, we are no intrude watchers nor police men. Can you arrest all intruders with such a telephone in Russia ? Probably not. But it's OK, if we find an intruder, to report it to our local intruder watch.

Hi Thomas,

It is only because some satellites are open access that we know that unlicenced interference exists in some countries.

CTCSS means you don't know about unlicenced activity in our bands.

I'd argue that the Amateur Radio community is better off knowing the unlicence activity exists and the areas it's coming from.

If we don't know about it no action will ever be taken and the unlicenced use of our bands will spread.

Several years ago Ib OZ1MY was able to produce a world map showing where interference to the Amateur Satellite Service occurred. He was only able to do this by monitoring Open Satellites, CTCSS sats provide no data.

CTCSS or not to CTCSS - that is the question ...

IMHO HO-68 is the most popular (and versatile) satellite ... and yes, it uses CTCSS

99.99% of *QRM* on the FM satellites is from RADIO AMATEURS who have *NOT* taken the trouble to learn how to operate on satellites ... where a RECEIVER is all importand - and actually LISTENING to it
is mandatory for successful contacts.

Have you not noticed that the CQ SATELLITE ... CQ SATELLITE clowns only manage to work other
CQ SATELLITE alligators.

Group,
You really should! have heard DK3WN work the 12:50Z AO-51 pass.

Now that's !!!! how to operate a satellite.

If you hear Mike ... listen and learn !!!.

Thanks John,

I've only had 2 QSOs to date - both through AO-7. One was Mode A and the other Mode B.

Hope to work you through one of the birds soon.

73, Phil G3XAP

In this "disclosure" new trend even APRS an 1980 old fashion "now" innovation just became a debit VS credit issue.

There is nothing against new communication mode as CW is but there will be always some to pretend the Darwin theory of evolution is wrong.

But who are we to voices opinion against the creator?

P.S. This message ia also posted on the Yahoo discussion group at
http://groups.yahoo.com/group/eu-amsat/
only serving as a living proof that even the creator can be wrong when he should not be...
It is the Lou Dobbs syndrome and it is related
to insects.

Hi All,

I have recently launched a new project in the UK call Project Oscar to promote Amateur Satellite service here in the UK. After all the talk of abuse and use of satellite in Europe, I hope to bring something to the market! Its aimed at beginners and we do work with Scouts and local radio clubs to promote better usage and practice! I cannot talk for the rest of Europe, but I will do my best in the UK!

Please have a look and make any suggestions.

http://www.projectoscar.co.uk

Thanks,

Chris

Good initiative, but if other countries doesn't follow, I'm afraid that it will not improve the general situation - especially on the FM-birds. It's not operators from the UK or northern Europe who are causing the chaos on these birds - it's generally stations in southern and eastern Europe.

3912. WET BLANKET on Project Oscar.

Yahoo group: eu-amsat
Date: 2010-10-27 08:29:59 UTC
From: John Hackett
Topic: 3908 Message: 3912

Hello Hans (and Chris!)
I wonder if Chris (Bloy) realises that 'Project Oscar' is a registered trademark.

I hope he's got permission to use it otherwise he may soon be looking at a lawsuit for a few million dollars.

Project Oscar was started in the Bay Area (San Francisco) by W0EEC (now N1DID), K7RR and KF4OTN in 1961 and to the best of my knowledge is still going strong.

They may (or may not) appreciate somebody else using the name. Personally, I'd check.

For all I know, Chris may have already received permission to use the name.

It's been a while since I was in contact with Emily (N1DID) so (I don't know how she feels about it but
if I was unsure ... I'd check because I don't have a million dollars lying around at the moment..

Sorry if I came across as a wet blanket but my intentions are good.

For those unfamiliar with colloquial English ... 'wet blanket' = putting a damper on the enthusiasm - but
well meaning.

Gentlemen ... (and Hans),
I was just copying HO-68 using 2 x wet matchsticks as an aerial ...
As usual, a *THUNDERING* signal with it's 200mW beacon.

How these 100 watt Yo-Yo's fail to hear the usual crop of decent operators answering them is beyond my comprehension.

They really *MUST* learn to take the bananas out of their ears ... or buy a receiver (!) to use in conjunction with the transmitter.

I've been led to believe that *LISTENING* after every fifth call 'sometimes' works too ... but that's probably
just a rumour.

Hi John,

Thank you for your email and information. I have tried to contact the US project Oscar for which is no longer from the information I have researched a registered trademark.

I will continue to try as I have sent a number of emails to Amsat US and UK but not had any response. The original club is no longer active but has been reformed as a club that appears to no longer meet.

Unless I hear anything negative, I will try and continue to run the site.

All the best,

Chris

Hello All

For the German language reading HAMs around the world I write
the OSCAR-News (international title) since more than 20 years
now. First for Swiss, Austrian and German HAMs via Packet Radio
and then international via Internet. I'm also the editor of
the worlds largest and most actual amateur satellite list for
launched and coming satellites at the AMSAT-DL homepage. This
is my "Project OSCAR" (please write OSCAR in capital letters)
for you all.

This will be only a platform for information but never a
"handbook for correct satellite operation". We all are adultly
Gentlemen and not in a kindergarten (I hope so).

Below in the footer you can find my website with all the links.

Hi Thomas,

Are you saying that I should stick to the OSCAR as capital too then?

I am more than happy to do this, I didn□t mean to make a scene just promote
this part of the hobby to my local clubs and scout groups?

Hello Chris

Yes please. It means "Orbiting Satellite Carrying Amateur Radio"
and has nothing to do with the firstname Oscar or Oskar. I have
also seen "Oskar-News" on a Swiss website - grrrr ;-)

> I am more than happy to do this, I didn?t mean to make a scene just

That's super. If you get any "Thanks for..." its a wonderful "job".
I write my news to learn English. Now my "write'n'read" English is
better than my listen English.

From: John Hackett
Topic: 3908 Message: 3918

FB !! Chris,
Glad you realised the mail was well meant. Wouldn't like to see a fellow Brit knackered by American 'politics'.

As for the initiative, well done! ... Hans is right, the UK operators are in general pretty good, as he says,
it's the southern & eastern European operators that need to take the bananas out of their ears.

It can onlyt be a good thing publishing recommended operating proceedure.

I tried to get Amsat-UK to do it in the 90's when I was involved with Oscar News but it was akin to
urinating into the wind.

The old boys club and all that, old boy (!) ... I do hope things have changed though in the last 20 years.

I wish you good luck Chris.

Remember ... it's easier to ask for forgiveness than ask for permission.

Subject: RE: [eu-amsat] WET BLANKET on Project Oscar.

Hi John, Thank you for your email and information. I have tried to contact the US project Oscar for which is no longer from the information I have researched a registered trademark. I will continue to try as I have sent a number of emails to Amsat US and UK but not had any response. The original club is no longer active but has been reformed as a club that appears to no longer meet. Unless I hear anything negative, I will try and continue to run the site. All the best,
Chris From: eu-amsat@yahoogroups.com [mailto:eu-amsat@yahoogroups.com] On Behalf Of John Hackett
Sent: 27 October 2010 09:30
To: eu-amsat@yahoogroups.com
Subject: [eu-amsat] WET BLANKET on Project Oscar. Hello Hans (and Chris!)
I wonder if Chris (Bloy) realises that 'Project Oscar' is a registered trademark.

I hope he's got permission to use it otherwise he may soon be looking at a lawsuit for a few million dollars.

Project Oscar was started in the Bay Area (San Francisco) by W0EEC (now N1DID), K7RR and KF4OTN in 1961 and to the best of my knowledge is still going strong.

They may (or may not) appreciate somebody else using the name. Personally, I'd check.

For all I know, Chris may have already received permission to use the name.

It's been a while since I was in contact with Emily (N1DID) so (I don't know how she feels about it but
if I was unsure ... I'd check because I don't have a million dollars lying around at the moment..

Sorry if I came across as a wet blanket but my intentions are good.

For those unfamiliar with colloquial English ... 'wet blanket' = putting a damper on the enthusiasm - but
well meaning.

3919. ARRISAT decay time?

Yahoo group: eu-amsat
Date: 2010-10-28 07:05:47 UTC
From: Luc Leblanc
Topic: 3919 Message: 3919

The first suitsat remain in space for one year. As ARISSAT will have more mass but less surface can we expected a longer life? I know that
a part of this ARISSAT experiment will be a test platform i only hope it will not be a test platform for the next ARISSAT who will be also
launch on another space station EVA?

Are they the new disposable LEO sat? instead of having HEO or higher orbit sat did they will now be sent one after the other in a way to
replenish the amateur radio satellite aging and dying fleet? The photo disposable camera was an ingenious concept as it rely on mass
production who will never be possible for an ARISSAT satellite.

Nobody will be against virtue but i failed to see the medium and long term goal here but probably i missed the missing link?

P.S. How much this ARISSAT experiment cost for AMSAT-NA? and for ARISS? Instead of words real figures will prove there is something moving
somewhere!

Luc, as I know there are no costs for the transport to the ISS and also
no cost for the handy release by an astronaut. ARISSAT is a real HAM
experiment and as such unique.

Once the shuttle is scrapped, there will be no more opportunities for this sort of craft. Soyuz, Progress and Dragon are all too small to carry this sort of experiment. Disposable cameras are one thing, but disposable spacecraft are quite another. I don't think you need worry too much Luc.

Topic: 3922 Message: 3922

Just worked AO-51 with 2 watts on an IC-E92D to an ELK on transmit and an Arrow on receive.

I was given an excellent audio report by Walt, ON5NY, Also worked Greece and Asiatic Russia,

Walter has the other 'key' to successful contacts. Clear, precise speech ... not too fast, easily understood.

Well done! Walt.

I hope people listen and learn from him too.

3925. FS: TR-751A

Yahoo group: eu-amsat
Date: 2010-10-29 18:35:43 UTC
From: LA2MOA
Topic: 3925 Message: 3925

Ok... Not sure if this is the right forum, but anyway - here it comes:

I have a substanial number of rigs here (TS-790E, TM-255, TM-455 and TR-751A) and at least one of them has to go if i will continue to be able to get into the schack. Well, the TS-790E has more or less alread found a nw homw, no problem it lacks 23cm anyway and my TM-255/455 is AT LEAST just as good as the 790. So, to make a long story shorter: I'm offering a VERY NICE TR-751A to a VERY NICE PRICE to the group. Lets say NOK 1600 + Shipping. The receiver is just as good as the one in my TM-255, it looks nice and it's working very nice both in CW and SSB (just ask Phil G3XAP or IK1SOW whom I've worked on HO-68 respecively in CW and SSB yesterday with this rig in the TX-end).

There are NO issues with the TR-751A whatsoever, no problems with the concentric volume/squelch/on-off-knob or any flickering lamps or LED's or anything. It's just sooooo perfect.

ANY inquiries about this wonderful radio is answered via e-mail to:

la2moa (at) gmail (dot) net

So, go on then, b4 it's too late... if not sold, I will put it in my car - which is a waist. This rig is simply too good for that...

3926. Arrows and Elk

Yahoo group: eu-amsat
Date: 2010-10-29 19:19:47 UTC
From: John Hackett
Topic: 3922 Message: 3926

Phil,
I bought my Arrow here ...

Contact Tim at sales@antennawarehouse.com

and my ELK here ...

<http://www.elkantennas.com/>

Both places give excellent service.

The Arrow (crossed yagis) is easier to hold when portable - the ELK (log periodic) is built like a brick sh*thouse.

The Arrow has 2 x BNC connectors for 2m & 70cm ... the ELK has a single PL-259.

IMHO the Arrow is more versatile --- especially if you *RIP* out the diplexer and bin it.

For portable ops - gp for the split boom model + carrying bag.

CC'd to the group for general interest.

Hans,
Arrow antennas don't ship outside the USA but their 'dealers' do.

AntennaWarehouse (*NOT* the Australian one with the same name) in the USA offers excellent service to Europe.

I'll give you 1600 Thailand bath for your TR-751 ... (about 319 kroner) ... KIDDING !!!!!.

I still use a 28 year old FT-290R ... or the IC-E92D at both extremities of technology ...

D-Star and MCW !!!.

(You can send CW by banging your dick on a biscuit tin)

Group,
It's good to see some light hearted humour on this forum ... refreshing! to see some really professional and well respected gentlemen not being pompous.

I wondered !!! why my guests always refused the biscuits.

Wishing everyone a good weehend.

73 John. <la2qaa@...>

Hi John,

Thank you and everyone else who replied to my plea for help regarding Elk/Arrow antennas. In view of what's been said, it's got to be the Arrow.

73 and thanks

Phil G3XAP

From: John Hackett <archie.hackett@...>
To: eu-amsat@yahoogroups.com
Sent: Fri, 29 October, 2010 20:19:47
Subject: [eu-amsat] Arrows and Elk

Phil,
       I bought my Arrow here ...

Contact Tim at sales@...

and my ELK here ...

<http://www.elkantennas.com/>

Both places give excellent service.

The Arrow (crossed yagis) is easier to hold when portable - the ELK (log periodic) is built like a brick sh*thouse.

The Arrow has 2 x BNC connectors for 2m & 70cm ... the ELK has a single PL-259.

IMHO the Arrow is more versatile --- especially if you *RIP* out the diplexer and bin it.

For portable ops - gp for the split boom model + carrying bag.

CC'd to the group for general interest.

73 John. <la2qaa@...>

Hi Hans

Tnx for the HO-68 QSO - and I can confirm that the TR-751A sounded very good.
That should get me at least 10% commission ;-)

Seriously, although I have worked few stations as yet, your signal was very good
compared with the majority.

Subject: [eu-amsat] FS: TR-751A

Ok... Not sure if this is the right forum, but anyway - here it comes:

I have a substanial number of rigs here (TS-790E, TM-255, TM-455 and TR-751A)
and at least one of them has to go if i will continue to be able to get into the
schack. Well, the TS-790E has more or less alread found a nw homw, no problem it
lacks 23cm anyway and my TM-255/455 is AT LEAST just as good as the 790. So, to
make a long story shorter: I'm offering a VERY NICE TR-751A to a VERY NICE PRICE
to the group. Lets say NOK 1600 + Shipping. The receiver is just as good as the
one in my TM-255, it looks nice and it's working very nice both in CW and SSB
(just ask Phil G3XAP or IK1SOW whom I've worked on HO-68 respecively in CW and
SSB yesterday with this rig in the TX-end).

There are NO issues with the TR-751A whatsoever, no problems with the concentric
volume/squelch/on-off-knob or any flickering lamps or LED's or anything. It's
just sooooo perfect.

ANY inquiries about this wonderful radio is answered via e-mail to:

la2moa (at) gmail (dot) net

So, go on then, b4 it's too late... if not sold, I will put it in my car - which
is a waist. This rig is simply too good for that...

73!

3934. The AO-7 log.

Yahoo group: eu-amsat
Date: 2010-10-30 19:35:04 UTC
From: John Hackett
Topic: 3934 Message: 3934

Just had a look at the AO-7 log again.

The same stations making the same mistakes ... over and over ... and over again.

We *ALL* make mistakes, it's human to err ... but you know what they say about the people who
make the *SAME* mistake time and time again.

You'd think that they could actually *SEE* how other people do it ... or ... know what date it is when they
made the contact.

The most 'popular' mistake is several line entries - despite! the ones above and below being on a single line.

There *IS* no excuse for not correcting mistakes ... it's been referred to here and on the Amsat-bb several times.

Again I ask people to please stop sending me requests to edit mistakes. I stopped editing the log more than 2 years ago.

Thank you.

3937. Questions about use of PC104 connector

Yahoo group: eu-amsat
Date: 2010-10-31 09:13:58 UTC
From: William L
Topic: 3937 Message: 3937

Hello AMSATs,

Work and home situation kept me away from having any ham time. But recently I had some time to continue with getting my transponder upgraded and with a PC104 connector.

The PC104 is a good choice for having a standarized inter connection system on CubeSat projects. However, I seen some deviation in the placement standard of this PC104 connector.

From the following website I read:
http://www.cubesatkit.com/content/electronics/bus.html

The CubeSat Kit Bus utilizes the same physical connectors as the industry-proven PC/104 bus, but in an alternate physical location so as to avoid unintentional damage to PC/104 or CubeSat Kit modules.

With focus on: "IN AN ALTERNATE PHYSICAL LOCATION"

I would like to know what this possition is, and if this is the golden standard in CubeSat world ?

My next worry is the pin configurations. Is there any standard for CubeSat boards ?

Next I would like to know how modules are controlled by the data bus.
Is it like separate pins for PTT, TX, RX etc...
Or with more smart communication with lines like: address bus, data bus, Clock, Interrupt lines etc. (similar to old ISA PC cards)
Or maybe with I2C.

I keep it to these questions for now...
Next questions will follow out of the answers hihi...

I saw this one at work a few weeks go. Quite an interesting movie.
From my viewpoint once you are over 30 feet up, if you fall off, you will probably die anyway ... so in that respect 1768 feet is really no more dangerous than 30. You will still go SPLAT! I have had to work on LASER comms systems at considerable height. I use proper ropes, a 4 point harness and proper equipment plus a hard-hat. So long as you take the proper precautions, you should be fine. Our electricians are a little more adventurous than I am. They have to abseil off the building to change out faulty floodlighting at times:-)
It's all concrete paving down below, but since the lighting is over 30 feet up, thats largely irrelevant.
Always take proper precautions!

Topic: 3935 Message: 3940

I'm a wimp! ... I only managed 200 meters on the NATO tower on Gossen Island and after an eventual
fall you land in a nice soggy bog ... but presumably, falling from 200 meters, even into a bog might just possibly knock the wind out of you for a couple of minutes.

I've also 'enjoyed' the view from the top of one of the towers holding up the shortwave curtain array on Kvitsøy Island, but that was only a only a 'baby' mast at a mere 170 meters. It does sway by 3m in a stiff breeze though so a safety belt is advised.

At the lower 100m you can climb inside the tower but the secont 70 meters has to be climbed externally.

I agree with GM1SXX. Falling from 200 or 30 meters onto concrete *ISN'T* good for your health.

3941. The AO-7 Resource Page Log ... again!.

Yahoo group: eu-amsat
Date: 2010-10-31 15:02:47 UTC
From: John Hackett
Topic: 3941 Message: 3941

Bernhard,
Please be aware that you're *NOT* filling in the AO-7 log correctly.

All contacts for a particular pass are supposed to be entered on a single line.

Yesterday, 30-10-2010 you made entries on different lines at 15:27, 15:28, 15:32 and 15:34.
Today, 31-10-2010 at 09:01, 09:10 and again at 10:01 and 10:06.

That's 8 different lines when there should have only been 3.

Long term, this makes a complete mockery of the object of the log ... as has been stated again and again ... and again ... here on the EU Amsat reflector and also on the Amsat-bb.
The log was *NEVER* meant to be
a points table.

It's an *ACTIVITY* log.

It should be perfectly obvious from all other entries that several contacts for a particular pass should be entered on ONE SINGLE LINE.

It is also not necessary to log 'heard' stations.

I forget the exact cost of shipping freight to the ISS but believe it's over $5000 a kilo, so getting a free ride is very welcome.

There was a post on the AMSAT-BB sometime ago about the cost to AMSAT-NA of the ARISSSATs, I recall it was low, under $12k.

Two out of those that were built are being shipped to Russia for launch, the first slated to fly this January. It should stay in orbit throughout 2011. Obviously the linear transponder will prove popular and I suspect many newcomers will be attracted by the SSTV pictures.

3946. Nig beans (?)

Yahoo group: eu-amsat
Date: 2010-11-02 09:44:45 UTC
From: John Hackett
Topic: 3946 Message: 3946

BIG BEANS? ... he means big beams!, folks.

This one is for those potential newcomers who (mistakenly) believe that you need *BIG* beams to work LEO satellites ... you DON'T !!!.

(It could also apply to the deaf 100 watt - 'mine's bigger than yours!'' - I don't need! a receiver, brigade too)

This morning at 021120100853Z I was 'messing' with my FT-290R - (I had no intention of working any satellites until later in the day) - I juat happened to tune across 145.943 when I heard F6FLE calling CQ.

On that frequency it of course had to AO-7 so out of curiosity I thought I'd see where the old girl was. I turned the computer on and backtracked to the exact time I heard the signal.

It turned out that AO-7 at that moment was at 353 degrees azimuth and 53 degrees elevation.

My simple ELK array was, as it always is when parked, was pointing to 90 degrees Az: and 0 degrees El:

Now ... taking into account that 6 element yagis have a vertical and horizontal beamwidth of approximately 40 - 50 degrees at the -3dB half power point it should be fairly obvious that a 'sharp' beam is *NOT* a necessity - especially! at the higher angles.

In fact, 5 or 6 elements with a half power beamwidth of 40 to 60 degrees is just about optimum for LEO's.

For thos not interested in aerials (???) ... it means I was receiving a good signal off the side of the beam.

Err ... unlike the FM satellites, to work the linear birds "ears" *ARE* highly recommended as 'extra' equipment.

73 John. <la2qaa@amsat.org>

3947. An opinion.

Yahoo group: eu-amsat
Date: 2010-11-02 13:01:11 UTC
From: John Hackett
Topic: 3771 Message: 3947

Apart from a couple of noteworthy exceptions - I still claim the operating practice on AO-7 is far more
civilised than that found on the FM satellites.

Of course, the height of the orbit - (read: length of operating time) - is the primary reason but operating technique - (2 different types of proceedure) - plays a significant role as well.

Hopefully, the FM only operators will progress to AO-7, VO-52, HO-68, FUNsat and Kiwisat - (if it ever gets launched) - and learn how to operate on linear satellites.

73 John. <la2qaa@...>

3948. Reasonable distance on AO-7

3949. QRM on HO-68

Yahoo group: eu-amsat
Date: 2010-11-02 16:38:08 UTC
From: John Hackett
Topic: 3949 Message: 3949

Could somebody please QSP to the Russian station concerned that *SHOUTING* into the microphone
doesn't make the signal any stronger ... but it *DOES* help to foster QRM.

Calm down !!! ... relax ... and a *LOT* more people will be able to make a contact.

In the last 15 minute pass only 3 contacts were made ... mainly due to so many stations QRM'ing eachother.

Give your callsign once! ... then *LISTEN* !!!.

Making transmissions like ... THIS IS UA3*** TRANSMITTING FROM P*** TO HO-68 CQ SATELLITE ...
only! causes QRM.

We all know that the idea is to keep transmitting continually, until there's a break ... but believe me, that's *NOT* the best way to get through the chaos already in progress. Improve your operating technique, listen, judge the timing of the QSO, nip in with your call ... once! ... then LISTEN !!!.

Remember ... you're competing with many other stations at any one time. There are over 50 'countries'
in Europe and a *LOT* of people trying at the same time. Read up on FM capture effect.

Remember that 5 watts is the recommended power. Some alligators are running 20 !!! times that and *STILL* can't get a contact ... which is due to poor operating proceedure ... *NOT* power.

These stations are 80% of the reason why the good operators can''t get into the bird.

Like I said ... *SHOUTING* does *NOT* make your signal any stronger ... honest!.

Relax!!! ... it's a hobby. Your life 'DOESN'T* depend on it ... WHICH IS JUST AS WELL !!!.

I think this message needs to be beaten in with a very big stick.

>(referring to AO-7).

>Remember! - AO-7 is an inverting transponder ... what goes up comes down ... he he he

>Make a list of the uplink frequencies starting at 432.125 uplink which corresponds to 145975 doenlink.
>Do this for every 5Khz ... 432.130 - 145.970 ... 432.135 - 145.965 and so on until you get to
>432.175 - 145.925.

You can then see what uplink you're using and where your downlink will be - plus/minus doppler.

Another 'trick' isto use an audio oscillator of about 800Hz with STEREO headphones ... one channel going to the uplink - one channel coming from the downlink - use a switch between oscillator and mic ... adjust your receiver until both tones sound the same ... you're then dead-on frequency.

Much !!! more fun than automatic doppler tuning. I'm still using 28 year old rigs on the satellites. I used to have a fully automated station ... BORING !!!!.

The above are a couple of the kind of things we need to teach the newcomers >>>

3951. For those of us who are missing FO-29...

Yahoo group: eu-amsat
Date: 2010-11-03 13:35:27 UTC
From: LA2MOA
Topic: 3951 Message: 3951

...the bird will come back, in scheduled operation in January and February. Right she's resting. Here's the latest FO-29 uptade from the JARL-team:

October 2010 update: FO-29 has reentered eclipses each orbit, and it's future operation is uncertain at this time. The older updates below will provide background, but the situation is the batteries are old, and the satellite shuts down when the batteries get too low. There was a malfunction in the system that turns the transponder back on after a shutdown, and it must now be commanded back on from the ground.

FO-29 update from JARL via Mineo Wakita, JE9PEL

JARL says: The eclipse rate of FO-29 suddenly changes from January to February, but it seems that the possibility of consecutive operation is low, because the malfunction occurs in the battery control circuit.

But we make a temporary operative plan and operate it, because there is the possibility of the spontaneous cure to be before approximately 2 years. When the surplus occurred for the electricity income and expenditure, we review an operative plan and do it.

It is operated until time to be OFF by UVC after a transmitter turned ON on the following date and time.

Jan. UTC
16 21:00-
22 22:33-
24 10:35-
29 21:25-
31 09:30-

Feb. UTC
5 22:00-
7 10:00-
11 11:40-
12 20:53-
14 10:40-

It does not limit the use of the analog system transponder, but please do uplink with the reasonable power. We may cancel the use of the next day depending on the situation of the examination use.

Does we need to say it twice? Yes, probably. So here it comes:

USE REASONABLE POWER ON THE UPLINK!!!

Hans / LA2MOA

3952. UT1EQ and F0FIG

Yahoo group: eu-amsat
Date: 2010-11-03 18:01:16 UTC
From: John Hackett
Topic: 3952 Message: 3952

Would somebody like to give UT1EQ a little heads-up regarding operating via an FM satellite.

UT1EQ QRZ? ... IT1EQ QRZ? ... UT1EQ QRZ? ... from 18:35 to 18:44 with just barely a pause for breath.

He heard only one of the *many* stations - (the 100 watt German one) - who were answering his call.
All had good clear signals. He didn't even copy the Russian stations trying to work him.

Surely in such a situation - (if it was one-way propagation hi hi) - it's time to let somebody else have a contact.

All honour to F0FIG who *DID* manage to hear and work my QRP despite the constant QRM from UT1EQ.

Perhaps he was just emulating the characteristic of that large green reptile that lives in the Florida swamps
and has long gaping jaws and very tiny ears.

Probably *TOTALLY* !!! unaware that he blocked the satellite for the whole pass.

Shared resource? ... yea ... right!.

Hello John and group,
I am more than intrigued to try to listen to satellites, and for the last days (or weeks) I am trying to put down a basic list of things I need for starting.After watching this group, I think that I am interested only on the linear transponders and not the FM birds!
If I am not mistaken and have gone through the right websites, currently the satellites that are fully operational are HO-68 and VU-52 followed by a number of semi-operational satellites like AO-7.
Suppose that I start listening on them first and possibly working through them later, I see that I need to have both a VHF and a UHF all mode transceiver. I can see some used FT-290/FT-790 transceivers on eBay in very good condition and price and was wondering whether a set of those along with an arrow-type 3x6 antenna would be adequate for starting and possibly working. I am pretty sure that their power output (~2.5W) is enough but I hesitate a bit on those transceivers because I have read that they are not sensitive enough (in general). Do you think that they are sensitive enough for satellite work? If not, would you suggest any other used equipment that I can use? (I do not know whether FT-290RII/FT-790RII is much better on the issue of sensitivity because so far I have not found any data on both to compare).
I do not really care about fancy features like DSP and auto tracking, I really like the simple basic rigs that still need an operator in order to work!

Hello Nick,
The FT-290 can be modifies with a Mutek 'hot' front end designed specifically for satellite operation.

The best 'old' rigs for satellite operating are the TR-751E and the TR-851E from Kenwood, 2m and 70cm repectively. Both these transceivers have sensitive front ends and are good for satellite operating without modification. Both have an output power of 25w (perfect).

If you absolutely *MUST* have auto-doppler tuning you can use Tony's ITUNE program (FREE) to tune them.

The FRT-290/790 pair are only recommended 'barefoot' for experienceds QRP'ers ... but they *ARE* RECOMMENDED for driving transverters.

Go for the TR-751E/851E pair and you can't go wrong NICK.

The same of course applies to 'comparison' rigs.

Hi Group,

Ok, so I think I can answer the oldest working Amateur satellite is...
(AO7!?)

But what about the oldest:-

Non-working Amateur Satellite still in-orbit? (AO-13?)
Non-working commercial sat? Vanguard-1?
Working commercial satellite still in orbit?

Many Thanks,

Chris

Nick,
No problem, here's the info.

LA2MOA reads this forum and he has a TR-751E for sale for 1600 Norwegian kroner plus postage.
Copntact him at ... <la2moa@...>

The automatic doppler correcting software is called ... 'InstantTune' ... and can be downloaded here ...
(It's FREE).

<http://www.amsat.org/amsat/ftpsoft.html#pc-it>

It's an old DOS program that funtions perfectly! with mic-pushbutton rigs like the FT-290R/TR-751E.
Be aware that it doesn't run under WinXP because Microsoft changed the way XP handles the interrupts.
It *DOES* run under Win2K though - (just use an older PC).

I used it successfully for years! ... and still do if I feel lazy.

Read the DOC ... you can build the interface in 10 minutes!.

BTW ... where did you find the sensitivity mod for the FT-290R?.

It appears that Mutek are out of business but I might try to do something with my own standard 'deaf'
FT-290R.

Of course a mast mounted preamp helps but getting rid if the lossy diode switch and installing a new filter + mechanical relay would perk up the front end. What was the sensitivity mod you mentioned ??.

Hello John,
thanks for the info.
here is the link to an old issue of Ham-mag
http://faucheux.free.fr/f5sld/3e.pdf
(If for any case the above link does not load the pdf file, please visit this page
http://ham.france.free.fr/crbst_17.html
and click on issue Number 3 March 2009)
There is a detailed article about giving a new life to your FT-290R. I cannot say whether this mod will transform your rig to a beast, but I am interested to hear the results if you try it.You know your rig's performance very good and you can say whether this mod makes it a better satellite machine (and how much better!).

working through them later, I see that I need to have both a VHF and a UHF all mode transceiver. I can see some used FT-290/ FT-790 transceivers on eBay in very good condition and price and was wondering whether a set of those along with an arrow-type 3x6 antenna would be adequate for starting and possibly working. I am pretty sure that their power output (~2.5W) is enough but I hesitate a bit on those transceivers because I have read that they are not sensitive enough (in general). Do you think that they are sensitive enough for satellite work? If not, would you suggest any other used equipment that I can use? (I do not know whether FT-290RII/FT-790RII is much better on the issue of sensitivity because so far I have not found any data on both to compare).

I do not really care about fancy features like DSP and auto tracking, I really like the simple basic rigs that still need an operator in order to work!

I have found a mod for FT-290 to improve the sensitivity and NF which will be my last resort if I do not find anything else!

Hi Nick, and the group.
Like John I've used the FT290/FT790 pair and I've now owned no less than 4 FT290's since 1985.(I still have two of them, fitted with MUTEK replacement front ends. I also have a TR751e. I'd like to say that my preference is for the TR-751e, but yes, I agree, they are difficult to find. For auto-doppler correction, if thats your thing, almost any radio that has microphone up/down frequency buttons could be used, especially if the steps are programmable as many now are. It's just that you need to find or make a suitable interface.

You'll find that the FT290 is used by many people as a transverter driver. Even the standard deaf ones are good for this job. Thats what mine do now.

As to price, I suspect you will find that any decent multimode radio will not be cheap.

HI Al and group,
I am after the TR-751 and TR-851 for a long time now but with no success and recently I decided to also look for FT-290 /790 because they appear more frequently.

The unfortunate part of my search adventure is that some times I do not check eBay daily and I have lost some good opportunities (for some reason my notifications from saved searches do not arrive on time). For example, 5 days ago i found a just-ended-auction for a TR-851 that was sold for only 170 Euros! I just missed it and I am very sad about this!
At the moment there is a running auction for a TR-851 on eBay
http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=170561083766
but the seller unfortunately does not ship outside Germany. If you think you have someone to pick-it up for you, maybe it is a very good opportunity.I would do the same If i had someone in Germany!
The last month I have seen 3 or 4 TR-751 (mostly from UK and Germany if I recall correctly) which either they were not shipped to Greece or they were sold at a very high price, but the TR-851 are really rare...no matter if 2 of them appeared within one week!
I am confident that I will find something soon!

Hello Nick,

Unfortunately, neither of the links work. The page
downloads but the actual issues of the magazine won't download.

Never mind, thanks for trying anyway.

The last info I found about the Mutek boards was 2005.

RThere's a notice on the website saying the page is being updated (2005)

I can't find any information after that.

My TR-851E is light years! ahead of tyhe FT-790. The perfect satellite rig if you prefer
REAL operating

... as opposed to the all-singing, all-dancing, push-button-a-minute-auto-doppler
tuning-fry-an-egg rig.

Hello John,
thanks for the info.
here is the link to an old issue of Ham-mag
http://faucheux.free.fr/f5sld/3e.pdf
(If for any case the above link does not load the pdf file, please visit this page
http://ham.france.free.fr/crbst_17.html
and click on issue Number 3 March 2009)
There is a detailed article about giving a new life to your FT-290R. I cannot say whether
this mod will transform your rig to a beast, but I am interested to hear the results if you
try it.You know your rig's performance very good and you can say whether this mod makes it
a better satellite machine (and how much
better!).

Nick,
No problem, here's the info.

LA2MOA reads this forum and he has a TR-751E for sale for 1600 Norwegian kroner plus postage.
Copntact him at ... <la2moa@...>

The automatic doppler correcting software is called ... 'InstantTune' ... and can be downloaded here ...
(It's FREE).

<http://www.amsat.org/amsat/ftpsoft.html#pc-it>

It's an old DOS program that funtions perfectly! with mic-pushbutton rigs like the FT-290R/TR-751E.
Be aware that it doesn't run under WinXP because Microsoft changed the way XP handles the interrupts.
It *DOES* run under Win2K though - (just use an older PC).

I used it successfully for years! ... and still do if I feel lazy.

Read the DOC ... you can build the interface in 10 minutes!.

BTW ... where did you find the sensitivity mod for the FT-290R?.

It appears that Mutek are out of business but I might try to do something with my own standard 'deaf'
FT-290R.

Of course a mast mounted preamp helps but getting rid if the lossy diode switch and installing a new filter + mechanical relay would perk up the front end. What was the sensitivity mod you mentioned ??.

Hello Nick,
The FT-290 can be modifies with a Mutek 'hot' front end designed specifically for satellite operation.

The best 'old' rigs for satellite operating are the TR-751E and the TR-851E from Kenwood, 2m and 70cm repectively. Both these transceivers have sensitive front ends and are good for satellite operating without modification. Both have an output power of 25w (perfect).

If you absolutely *MUST* have auto-doppler tuning you can use Tony's ITUNE program (FREE) to tune them.

The FRT-290/790 pair are only recommended 'barefoot' for experienceds QRP'ers ... but they *ARE* RECOMMENDED for driving transverters.

Go for the TR-751E/851E pair and you can't go wrong NICK.

The same of course applies to 'comparison' rigs.

>Much !!! more fun than automatic doppler tuning. I'm still using 28 year old rigs on the
>satellites. I used to have a fully automated station ... BORING !!!!.

Hello John and group,

I am more than intrigued to try to listen to satellites, and for the last days (or weeks) I am trying to put down a basic list of things I need for starting.After watching this group, I think that I am interested only on the linear transponders and not the FM birds!

If I am not mistaken and have gone through the right websites, currently the satellites that are fully operational are HO-68 and VU-52 followed by a number of semi-operational satellites like AO-7.

Suppose that I start listening on them first and possibly
working through them later, I see that I need to have both a VHF and a UHF all mode transceiver. I can see some used FT-290/ FT-790 transceivers on eBay in very good condition and price and was wondering whether a set of those along with an arrow-type 3x6 antenna would be adequate for starting and possibly working. I am pretty sure that their power

As we progress deeper and deeper in the universe we are always entilted to stumble over new encounters. As a suggestion in the new
interstellar probes this video can make a nice visit card. I was for myself involved in a kind of encounter this morning around 0730 UTC on
3780KHZ with a group of stations from UK and Spain that i worked in a row: EI6S, G3LNP, G4OFY, G3UCK, G5LND, GI0VIE, G4PEL, GW4RIB

Few hours prior to theses encounter i worked on AO-51 in L/S-U mode (S on my side) KE3LB, N2JK, N2VYT, W7GPI, N8RO AA5CK, KC9ELU, KO4MA,
K8YSE, WB8OTH

As written by Drew KO4MA "In January AO-51 leaves continuous illumination for many years and many of these modes
may not be possible due to power budget and battery condition." Is this mean the above mentioned stations will be the last ones operating
on L/S mode on AO-51? Can i refer to this encounter as the "Last L/S encounter in a kind"

From: John Hackett
Topic: 3966 Message: 3966

Sawatdee Al,
The young Spanish Lady? ... yes ... Miss Conception.

Seriously, it's a misconception that you need a multimode transceiver to copy HO-68's telemetry.

The following was copied on my IC-E92D FM handheld ... in AM mode ... which has no BFO (!).

Saturday 06-11-2010.

07:56

BJ1SA XW XW AAA TTB AAB ATT ETT TTT TTT TTT TTT TTT TTT TTT TTT XW XW

07:57

BJ1SA XW XW AAA TTT AAB AUE ETT TTT TTT TTT TTT TTT TTT TTT TTT XW XW

07:58

BJ1SA XW XW AAA TTT AA6 TNT TTT TTT TTT TTT TTT TTT TTT TTT TTT XW XW

(I could go on, but I won't)

Now, if I can copy HO-68's beacon on my *FM* handheld (in AM mode) *WITHOUT* a BFO - the next 'experiment' is to use my 'Spice Box' keyer ...

<http://www.observations.biz/Observations_from_Norway/observations_14_06_2008.htm>

... to transmit CW on the A band in FM mode, by keying the PTT - (AO-7's uplink) - and receive on the
B band in AM mode - thereby dispelling the myth that you need an expensive multimode rig to operate on linear satellites.

Of course, this is reserved for the CW operators and there we have a minor glitch since a lot of the FM brigade don't know what CW is.

Why do I bother when I've operated a fully automated station both professionally and as an amateur?.
Because after 10 minutes, the novelty of an automated station wears off. I tried 200mW for a while but that was too easy (no challenge) but it *DID* amuse my warped sense of humour having 200mW QSO''s qhile the 100 watt clown were calling CQ SATELLITE constantly - and not being able to work anybody.

Therefore ... new challenge ... CW operating using a 'single' FM handheld with no BFO.

... and by the way, you *CAN* copy HO-68's beacon on an Arrow indoors in a ground floor flat...
(I just did) ... so the 'excuse' of needing a *BIG* beam doesn''t hold water either.

CC'd to the group for general interest.

Imet horoshii den ... (have a good day, to you! ... and our Russian 'brethren').

73 John. <la2qaa@...>

3967. IC-E92D on CW.

Yahoo group: eu-amsat
Date: 2010-11-06 15:35:04 UTC
From: John Hackett
Topic: 3967 Message: 3967
Attachments: 1 described; binary payloads are missing from this source WARC

Hello Al,
Thanks for the MCW link - pretty much the same as the attached PDF I had on the computer.

I just take the audio output from my 'spicebox' keyer and feed it to the mic of the IC-E92D via a 2.5mm
to 2 x 3.5mm jack socket ... that way I can use the PTT, audio in *AND* speaker out, using the special ICOM patch lead.

The IC-E92D has a dedicated 12 pin connector that is waterproof but you do of course need an Icom lead since these connectors are made of unobtainium that resembles a military rubber grommet 'thingy'. It's the only way IN and OUT of the handheld since it has the standard walkie-talkie type PTT.

My system works fine on HO-68. Copied myself on AO-7 too this afternoon but I was *VERY* weak on AO-7 using the IC-E92D in the AM mode. I was trasmitting 2 watts on the TR-851E ... actually, it was nearer 2.25 watts so I was really cranking up the power (QRO) today ... (he he he).

I did blow the "sophisticated rigs and *BIG* aerials" theory out of the water though.

As previously mentioned ... the great *DISADVANTAGE* of this system is that you have to close your mouth
(!!!) and actually listen so it'll *NEVER* become popular.

(Well that cuts out 50% of em' .....LA2QAA).

Again CC'd to the group - in case anyone else is as daft as me and wants to compare notes.

73 John. <la2qaa@...>

Nothing strange about the telemetry itself, quite nominal in fact. The point to note is that it was copied
on an FM handheld - WITH NO BFO - (an IC-E92D) - in AM mode.

As a CW afficiondo I derive more pleasure from ''messing' about with the king of modes than shouting
my head off on the FM satellites ... but if that is your pleasure, be my guest.

It''s strange that after more than 140 years - and for all of today's modern technology nobody has yet
devised a more effective system of communication than CW.

... and before you all dash off to your keyboards to negate a reply I might add that when I say 'effective',
I'm implying ... efficiency, low resource demand, weak signal capability, not too much brain power required ... (I could add a few extra comments there, but I won't).

So why am I babbling about this? ... go back to the first paragraph - but read and *DIGEST* it this time.

First and foremost I'm trying to dispell the nyth that you need an expensive multimode rig to work a linear satellite ... rubbish !!! ... go back and read the first paragraph again! ... but this time, digest it.

I believe that the survival of amateur radio depends on amateurs showing that they are - (once again?)
capable of doing something more! than any average 8 year old girl can do on MSN or Yahoo.

The object of the exercise is to dispel the myth that you need an expensive rig to work a linear satellite ... rubbish !!!.

I believe to retain any kind of respect in amateur radio we have to show that we are capable of doing *MORE than Joe Bloggs - (John Doe, for our American brethren) on MSN orTwatter ... (that one is for LA2QAA & GM1SXX) ... and we're *NOT* going to do that by shouting like a bunch of demented OAP's

on FM.

OAP's is an accronym for Old-age pensioners.

THUD! ...

(falls off soapbox).

Hello Hans,

>Let me know when you're ready for a "FM-CW"
>try on any of the linear birds. I will listen for you!

That would be good Hans, then I can avoid some clown coming back and saying my keying is 'up and down' ... and me having to explain that ...

1) It's being transmitted on FM ... err ... *FREQUENCY* modulation ... and ...

2) It's an experiment !!! ... to dispel a common myth.

FACT:

We used to operate CW on FM many years ago using handheld FM rigs as a transmitter, keying with the PTT.
As far as I'm aware, nobody has had a CW QSO using a *SINGLE* handheld dual mode rig for TX and RX.
That is to say, transmitting CW on FM and receiving the reply on AM.

A pseudo mini linear satellite rig.

My Spicebox keyer's audio tone allows for this - semi duplex to be sure, to be sure but I've never had a
problem on HF with semi duplex in 40 years!.

The problem with being taught to use FM satellites is the omission of the importance of the ears!.

73 John.

CC'd to the group for the general interest factor.

Hello John

Why do you not operate in FSK-CW ? All FM-TRXs has a knob for a 1750 Hz
tone. ITuPSat sends its beacon also in FSK-CW.

I see the AO-7 log is in it's usual state of disarray. Amateurs? ... above average intelligence? ...

(caugh) ... (caugh) ... (grin).

Congratulations to IK8YSS and W7LRD for managing to work stations while the transponder is OFF.

(Of course! it wasn't off - everybody else! managed to get it right).

Special congratulations to IK8YSS (despite his few 'correct' entries, he still manages to make a mistake
almost every single day!).

Did I say sloppy logging last month? ... surely !!! I was wrong?.

(Yes, it's my pet 'whinge' ... Hey! Igor, I'm trying for heart attack nr 5).

THUD!.

(Falls off soapbox).

For those that *DON'T* posess a sense of humour ... ridicule seems to be the only method of getting the message into some of those cast-iron heads.

3977. Wheeeeeeeeeeeeeeeeeeeeeeeeeeee !!!

Yahoo group: eu-amsat
Date: 2010-11-15 18:30:22 UTC
From: John Hackett
Topic: 3977 Message: 3977

Once again, chaos reigned supreme! on the early evening pass of HO-68 in FM mode with the usual
crowd climbing on top of eachother like a monolyth and *TOTALLY* blocking the transponder for 80%
of the entire pass.

Among the more umusing was the infamous and repetative ... "59, please repeat your callsign" ... from
UT1EQ to *EVERY* station who made a transmission - (including! those who were calling somebody else) ... surely a sign of a lack of receiving capability? ... or perhaps more simply, a lack of actually listening..

The club members here refused! to believe that most of these stations were actually licensed radio amateurs.
Quite reminiscent of chipmunks ... on speed.

While I believe amateur satellites should *NOT* be out of reach of the average radio amateur who is not a millionaire - there's not a shadow of a doubt that the QRM level and atrocious operating is far! worse on HO-68 than it is on AO-51. I believe this is a direct consequence of the fact that HO-68 is easier to access and requires much lower levels of receiver sensitivity.

... some would say - (judging by the operating) ... no receiver at all !!!. I'm kidding. I believe most operators *DO* have receivers but in the heat of the moment often forget to switch their ears to the *ON* position.
The 'trick' is to combine the mouth and the ears to operate each at the right time. 80% of the pass seems to be spent with everybody talking and nobody listening.

This evening, there were not only one or two calling at the same time - there were three or four!.

I *DON*T* believe that these stations can't hear eachother ... I believe they just keep on talking despite!
the fact that somebody else is talking. That makes it very poor operating practice.
Combined with the natural alligators - (those that can't !!! hear what's going on) - it's a natural recipie for chaos.

There *ARE* instructions for recommended operating proceedures for FM satellites freely available on the internet ... whether these people are unaware of them or simply don't bother - I wouldn't like to hazard a guess ... but if I was forced, I'd bet on the latter.

And this is an other negative example against FM operating over
satellites:
http://www.southgatearc.org/news/november2010/interference_to_satellites.htm
http://www.youtube.com/watch?v=ncA5c9BPeNY

We have fairly enough FM sats in the orbit, why not switching HO-68
steadily into linear transponder operation ?

There is a problem in the AMSAT-BB spam mail filtering but none towards this one sent on November 17 by me who was censored "AGAIN" by an
AMSAT-NA coward official who silently do his (Her...) dirty cheap job hiding himself (or herself...) behind their Acceptable Use Policy for
the AMSAT Public Mailing Lists.

That's why before sending money to support their satellite building campaign i asked who will administering the money? If it's to be return
back to any AMSAT-NA general or specific account a fair transparency minimum is to disclose it to the crowds.

Blocking my question on AMSAT-BB is already telling a lot about AMSAT-NA BOD behind the doors tricks and cheating! Nothing new will you say
AMSAT-NA BOD always pretend to be a free open and international group but in the recent past the international word vanish from any of
their papers as the words free and open also vanish under their Acceptable Use Policy for the AMSAT Public Mailing Lists.

A double standard group who prefer to maintain their membership in ignorance... It is more and more a trend that we can extrapolate at a
much higher scale too...

3982. Nanosail-D - wrong frequency

Yahoo group: eu-amsat
Date: 2010-11-18 14:20:14 UTC
From: Thomas Frey
Topic: 3982 Message: 3982

Hello All

Today's Southgate AR News (http://www.southgatearc.org/) are very interesting because of the launch of new satellites with HAM radio payloads. But Nanosail-D has a coordinated frequency of 437.305 MHz and not 437.270 MHz, see
http://www.amsat.org.uk/iaru/finished_detail.asp?serial=115

437.270 MHz is the coordinated frequency of Nanosail-D2, see
http://www.amsat.org.uk/iaru/finished_detail.asp?serial=166

Another satellite on the same launch is RAX "Radio Aurora Explorer", see http://rax.engin.umich.edu/ and
http://mstl.atl.calpoly.edu/%7Ejfoley/Spring2010/Spring%20Workshop%202010%20PDFs/April%2021%20Wednesday/0940%20Bennett_RAX_CSWorkshop_2010.pdf

Hi Thomas,

I believe that NanoSail-d didn't make it to orbit and this is infact NanoSail-D2 going up?

Also the same frequency is shown on the NASA page as .275

Thanks,
Chris

Yes, this could be possible. There was a failed launch in 2008
of a NanoSail.

>
> Also the same frequency is shown on the NASA page as .275

We can observe both frequencies then. Then we knows which
Nanosail, D or D2, is in orbit. Do you know of a project
homepage ? Its difficult without one. What is the URL of
this NASA page ?

3987. UK Space Agency to use AMSAT-UK FUNcube Boards

Yahoo group: eu-amsat
Date: 2010-11-18 23:10:51 UTC
From: Trevor .
Topic: 3987 Message: 3987

The UK Space Agency is proposing to use the AMSAT-UK FUNcube boards as part of its innovative new CubeSat UKube-1 slated for launch in December 2011.

The United Kingdom Space Agency website now includes some more details of the UKube-1, a 3U CubeSat (10 * 10 * 30cm) project. See
http://www.ukspaceagency.bis.gov.uk/20084.aspx

The baseline design for this satellite includes a set of FUNcube boards to provide the educational outreach for the project. AMSAT-UK are presently discussing the precise details of this arrangement with the UKube-1 project team. This development will enable a much higher level service to be provided for Science, Technology, Engineering and Mathematics (STEM) outreach to schools than would be possible with just a single spacecraft.

An information pack is provided by the UK Space Agency is at
http://www.ukspaceagency.bis.gov.uk/assets/ZIP/CubesatAOpayload.zip

In it they reference two International Amateur Radio Union (IARU) documents regarding the Amateur Satellite Servivce:
[AD-05] IARU Amateur Satellite Frequency Coordination Request (IARU-ASFCR) (Rev. 2009-03)
[AD-06] IARU Amateur Radio Satellite (IARU-ARS) guidelines (Rev. 2006-10)

BBC report on UKube

Thomas,
Luckily, the bad manners of young Glasbrenner on the amsat-bb is *NOT* typical of most Americans.

Both Luc and Domenic will tell you, stating an opinion that *DOESN'T* suck up to 'party policy' on that particular reflector is *NOT*
to be recommended ... that is to say, if you have an opinion that differs from Mr Glasbrenner you will be excommunicated in very short
order indeed.

At first, I assumed the gentleman was merely suffering from a 'bad day' syndrome but after personal experience off list I realised this is apparently normal behaviour for the aforementioned gentleman.

Don't worry about it Thomas, you're not the first to incur the (misplaced) wrath of this person - and you most certainly won't be the last.

This reflector ebraces! people who have an opinion of their own.

Hello Marco

This are my collected infos:

***

NanoSail-D2
==========
Center for Robotic Exploration and Space Technolog

NanoSail-D2 is a triple cubesat proposal. It will be in a low earth orbit at 72 degrees inclination. This submission is for a beacon on board NanoSail-D2.One orbit takes about 98 minutes. The orbit is planned to be nearly circular with an altitude of 635 Km at the start of the mission, degrading to 200 Km at which time it would deorbit. The time from launch to re-entry is expected to be 70 to 100 days. It is planned that the NanoSail-D2 UHF downlink Beacon will always be operating from launch to re-entry unless there is a satellite anomaly. Command will take place on frequencies outside the Amateur Satellite Service.** Coordinated beacon downlink frequency of 437.270MHz has been agreed**
http://www.amsat.org.uk/iaru/finished_detail.asp?serial=166

NanoSail homepage at http://nanosaild.engr.scu.edu/dashboard.htm
73 Trevor M5AKA

Space Flight Now reports on the upcoming launch of NanoSail-D which carries an Amateur Radio payload on 437.270 MHz

The satellite is slated to launch at about 02:24 UT on Saturday Nov 20.

Read the Space Flight Now article at
http://spaceflightnow.com/minotaur/stps26/101116nanosail/

If you are able to capture the beacon telemetry, please take the time to file a report at http://beacon.engr.scu.edu/Submission.aspx which is an interface to the Beacon Data Processing System.

*** NanoSail-D deceased because of a failed launch in 2008

O/OREOS
=======
This is a 5kg triple cubesat mission. The name O/OREOS comes from "Organisms/Organics Exposure to Orbital Stresses NanoSatellite" A UHF beacon is proposed with TC and TLM using the 2.4GHZ ISM service. Planned for a Dec 15th 2009 launch from OSC at Kodiak Island, Alaska into a 635km 72 deg inclination orbit. Beacon downlink has been coordinated on 437.305MHz. For more info see
http://www.amsat.org.uk/iaru/finished_detail.asp?serial=146

O/OREOS Amateur Radio satellite beacon

Samudra, N3RDX, provides information on the satellite O/OREOS Amateur Radio satellite beacon which will be on 437.305MHz from this Saturday UT.

On the AMSAT bulletin board he writes:

I have been requested to spread the word to the amateur radio community for the O/OREOS 3U cubesat to be launched this Friday [AST] on a Minotaur IV from Kodiak Island, relayed from Dr. Pascale Ehrenfreund of The George Washington University, Space Policy Institute.

AX.25 437.305 MHz Beacon decoding information:
http://beacon.engr.scu.edu/BeaconProcessingSystem/OOREOSBeaconDecoding.pdf

If you are able to capture the beacon telemetry, please take the time to file a report at http://beacon.engr.scu.edu/Submission.aspx which is an interface to the Beacon Data Processing System.

The O/OREOS project is co-sponsored by Santa Clara University, Ohlone College and NASA

Note the same system is used for reporting beacon data from GeneSat, PharmaSat and NanoSail-D.

73 de Samudra Haque, N3RDX

Fastrac-1 + Fastrac-2
=====================
University of Texas Satellite Design Lab

Two satellites which will separate after launch and experiment with cross link communications using 1k2 and 9k6 AX25 packet. The purpose of the FASTRAC mission is to investigate enabling technologies crucial for satellite formations, including on-orbit relative navigation, attitude determination, micro-thrust capability, and satellite crosslink communications. This will be achieved by taking on-orbit data from a

pair of twin satellites that will separate once in orbit. The data will be collected through a network of civilian ground stations and evaluated through post-processing of the recombined downlink message.The main experiment is planned to last approximately one month after launch and the satellites will remain operational until they fail or re-enter (assumed to be six months after launch).There is also radio beaconing and store-and-forward capability on each satellite that can be used by the amateur radio community after the main experiment is completed. Fastrac 1 Downlink 437.345 MHz* Now planned for a Minotaur IV launch from Kodiak Alsaka in late summer 2010** More info at fastrac.ae.utexas.edu

Dear members of the University Nanosat, Cubesat, and Amateur Radio communities,

As many of you may know, the FASTRAC satellites built by students at UT-Austin will be launched as part of the STP-S26 mission this upcoming Friday Nov 19th (around 4:30 pm AST) from Kodiak, Alaska on board a Minotaur IV rocket. The satellites will be placed into a 650 km altitude, 72 degree inclination circular orbit. For those that don't know, the FASTRAC satellites are the winners of the University Nanosat-3 Competiton and their primary mission is to demonstrate enabling technologies for small satellites.

The satellites have been designed the satellites so that amateur radio operators can track them all over the world and to do so the team has built a section on our website (http://fastrac.ae.utexas.edu/for_radio_operators/overview.php) that allows any amateur radio operator to upload data they receive from the satellites. This serves two purposes which are that the website will parse and graphically interpret the data received and also allows the team to collect data from all over the world.

With this in mind we would like to invite you to track our satellites and register on our website. All of the information to track the satellites is available on the above website where we will be posting the most up to date TLEs as they become available as well as any other pertinent information. Also, we will be posting updates as the launch approaches on our website, our Facebook page (www.facebook.com/fastracsats) and our Twitter page (www.twitter.com/fastracsats) so make sure to chek them out.

Thank you for your help. 73,

Glenn Lightsey (KE5DDG) and Sebasti?n Mu?oz (KE5FKV)
FASTRAC Principal Investigator and FASTRAC Student Program Manager

The FASTRAC Amateur Radio satellites built by university students are scheduled to launch from Kodiak, Alaska, on Saturday, Nov 20 at 02:24 UT. KE5DDG and KE5FKV have requested the help of the Amateur Radio community in tracking them.

The two FASTRAC satellites will have packet radio AX.25 beacons on 437.345 MHz and 145.825 MHz FM.

FASTRAC sats to be open to all Radio Amateurs

FASTRAC faculty adviser, Glenn KE5DDG, reports that the two FASTRAC satellites slated for launch around 02:24 UT on Saturday, Nov 20, will become available for Radio Amateurs as Digipeaters as soon as the primary mission experiment is completed.

The FASTRAC project clearly demonstrates how University CubeSat projects help attract more people into Amateur Radio with 10 people getting their licences as a direct result of working on the project.

On the AMSAT bulletin board he writes:

Many of the students who have worked on FASTRAC have amateur radio licenses, and it was our hope to engage the global amateur radio community in our project from the beginning. After launch on Nov. 19 [AST], the best way anyone can assist us is by tracking our signal, and uploading any data you collect to our web site:
http://fastrac.ae.utexas.edu/for_radio_operators/users/phpBB3/frontpage.php

Once you are registered on our web site, we will track how much data is collected by individuals and you can view health and status information about each of our satellites (FASTRAC-1 and -2, also known as Sara Lily and Emma).

After the main experiment is done, amateur radio operators can use the satellites as two-way digipeaters for as long as they remain operational.

We really appreciate all the advice and help that we have received from the amateur radio community over the years. Now, with a little bit of good luck, it will soon be time to enjoy the result!

73, Glenn KE5DDG

Congratulations Francisco. With my keplers OOREOS was over the west coast
of Greenland. I think I have wrong keplers. Can you tell us yours ?

3998. RE: [eu-amsat] OOREOS Received!

Yahoo group: eu-amsat
Date: 2010-11-21 17:48:26 UTC
From: Marco IK1ODO
Topic: 3995 Message: 3998

I confirm that OOREOS is loud and clear, and very easy to decode.
RAX is active too, the keps published by DK3WN for FASTRAC match quite well:

FASTRAC
1 90025U 0 10324.91941279 +.00047321 +00000-0 +66105-2 0 00053
2 90025 071.9688 138.3615 0022609 310.2956 049.6065 14.77203256000130

RAX is much harder to copy, I only get a good packet every 2 or 3. It
decodes acceptably on my IC-901H + TNC7MULTI, not so well on my
Perseus + VAC + MIxW.
No trace of FASTRAC however; weak signals by Saturday, not seen
today. Anyone has news?

I think Mike will agree with me, the program is ONLINEKISS (correct me if I☐m wrong). It☐s available in the software section of www.dk3wn.info

This is the shortcut to download
http://www.dk3wn.info/files/agw_online_kiss.zip

Thanks to Mike for his effort and his programs!

4003. QRM

Yahoo group: eu-amsat
Date: 2010-11-22 12:32:45 UTC
From: John Hackett
Topic: 4003 Message: 4003

For general interest.

The 13:10 pass of AO-51 was totally blocked by rebroadcast QRM.

One QSO between 2 x Russian speaking operators - NO CALLSIGNS GIVEN - followed by what sounded like a female taxi despatcher at work.

Whether this was a deliberate rebroadcast transmission, I really don't know.

73 John. <la2qaa@...>

Hi Group.

This is not a new problem for AO51. It's been documented before, by Ib OZ1MY and Domenico, and others. It seems that both Spanish and Russian taxi drivers, not to mention fisherman, Spanish and otherwise, often use the amateur bands. So long as cheap radios covering the amateur bands are readily available to unlicensed people, I'm sure the problem is set to grow in magnitude.

These radios are also fairly popular on building sites, and elsewhere, where cheap radio communication is needed. I suspect they are used because they cost a fraction of what the commercial grade radios do, but the users don't care about bandplans etc. They just TX wherever they like. It's not illegal for the general public to *buy* these radios and they are on sale almost anywhere you care to look. I'm told even some radio amateurs use them :-)

Many of the foundation class license-holders around here on VHF + 70Cms could be easily mistaken for fisherman.... no callsigns and plenty of swearing. How to tell them apart.... that's the difficulty.
They all sound the same to me.

4007. 2001 v 2011

Yahoo group: eu-amsat
Date: 2010-11-23 19:18:27 UTC
From: John Hackett
Topic: 4007 Message: 4007

10 years or so ago it wa standaed operating proceedure to ask if the frequency was in use before
calling CQ ... QRL? if you were on CW.

Today, on satellite, it appears this has gone out of fashion.

When operating QRP, one *EXPECTS* to be stomped on on the FM satellites but it's just a 'tad' tedious
experiencing it on HO-68 in linear mode.

I won't embarrass the stations concerned by giving the full callsign but it does appear that the prefixes
IK and F0 appear more than any other.

I'd been operating with Igor UA9GW so my QRP *was* being heard when the IK station came on the frequency and started calling CQ - without asking if the frequency was in use.

I completed the QSO with Igor and tuned either side of the frequency which, of course, was completely clear.

I can only wonder if such QRM was deliberate or whether both the IK station and the F0 who answered
him had less than optimimun receiving systems ... (read: ears in the *ON* position).

The propagation 'can' be different at various QTH's but it's fairly unlikely that both Italy *AND* France were experiencing an RF blackout at the same time ... on the same frequency ... since they could obviously hear eachother OK.

It's another one of the challenges of QRP.

Hello John

I often observes on the Linear Transponders that all callers are concentrated
around the middle of the passband. During a QSO they do not correct the uplink frequency with doppler, so they moves downward in the passband and stomps over other callers or QSO's. If all users would correct the uplink only for a fixed downlink QRG we would have much less trouble with "stompers".
Name it the HB9SKA-rule if you want. ;-)

With AO-10/13 in a HEO orbit with very low doppler we had never such problems.

I agree with Thomas,
There were also three (3) other differences in the good old AO-13 days.

1) People actually *LISTENED* before transmitting.

2) Operators *ASKED* if the frequency was in use before calling CQ.

3) The only *FM* (amateur) satellite in general use was AO-27 ... and the standard of operating was
light years ahead of today's chicken shack operating ... but in those days, you had to *prove* you were competent to be let loose on the airwaves.

It should also be remembered Thomas ... there's a vast difference between a 15 minute LEO and an
11 hour HEO pass - and all that it entails regarding doppler.

Hello John

I often observes on the Linear Transponders that all callers are

concentrated

around the middle of the passband. During a QSO they do not correct the

uplink frequency with doppler, so they moves downward in the passband and

stomps over other callers or QSO's. If all users would correct the uplink

only for a fixed downlink QRG we would have much less trouble with

"stompers".

Name it the HB9SKA-rule if you want. ;-)

With AO-10/13 in a HEO orbit with very low doppler we had never such

problems.

4010. New award. Soyuz-Apollo

Yahoo group: eu-amsat
Date: 2010-11-24 09:25:51 UTC
From: John Hackett
Topic: 4010 Message: 4010

Excellent! Igor,
I've forwarded it to the group too.

Personally, I can't work the ISS, I'm too far north. I need either a polar orbit or an HEO satellite.

Due to the mountains here the mid-day passes over Russia at about 10 degrees are the best for me.
It keeps the southern European QRM out of the passband.

Not only is the QRP a challenge, I have to carefully judge when a satellite is not behind a mountain too.
... plus the fact that no antennas allowed here so I just do the best I can.

I miss my old satellite beams from the other QTH.

Excellent! chaps,
ES8DH Robert running 1 watt, RW3XL Igor running 2 watts, LA2QAA John running 1 watt.
All with excellent copy on the 12:33 AO-51 pass today, 24-11-2010.

That's !!! the way to do it.

I wish I'd recored it - to show how it should !! be done.

If we keep reminding people, the message just *MIGHT* eventually sink into the alligator heads.

For those who are used to 100 watts on HF ... 2 watts on satellite, with proper operating technique
IS sufficient.

"It is vain to do with more that which can be done with less" ... William Of Occam ... 1288 - 1348.

(from ... The Principle Of Sufficient Reason).

All right!
I do agree with satellite QRP no matter what.
This afternoon, myself and PT9IR tried a contact on FO-29 with 2,5watts and guess what?
I did hear him with arm chair copy! For those not used to that expression: it means I heard him very very well!
I don't see the need for QRO. One needs to improve its ears!
By the way, I had a 12 elem 435MHz yagi and none preamp whatsoever!
Keep your power down to the lower limit! You get more fun out of it!

The Russian Federation Yubileyniy 2 (RS 40) is slated for launch on March 30 into presumably a similar orbit to the main Gonets payload - 1350km 82.5 deg.

Does anyone have any details of the Amateur Radio payload that it will carry ?

Hello Trevor

Yubileiny-2 will have most likely a DOKA-Transponder which transmits in our 435MHz-band and NOT an HAM-payload !!

A few weeks ago over a weekend I heard Yubileiny(1) at the same time as AO-51. It was an interference for a short time, but we can not accept such intruders !

Hi Trevor, and group.

Yubileiny-2 is a Reshetnev bureau product. You should find more on their website. I came across an article today in the company magazine which makes mention of Yubilieiny-2.
http://www.iss-reshetnev.com/?cid=iss_magazine
Look for Issue 9

I haven't had time to look for more detailed info yet. It's likely that it will be launched as a secondary payload alongside a messenger satelite 'Gonets'. I suspect it won't be a 'real' amateur bird in the sense that it will not carry a transponder. I'd also be rather surprised if it doesn't carry the DOKA-B control system that caused so much gnashing of teeth with the first bird.

Hi Group,

Just a little bit of digging reveals that Yubileiny is a SIBSAU (Siberian State University) project in conjunction with Reshetnev Bureau. Yet another University bird hijacking the satellite sub-bands.
You may find more detail here. http://www.sibsau.ru/

Hi Group.

Whats the difference between another downlink only 'amateur radio' University bird and Yubileiny 1 or 2? How can one University 'downlink only' bird be classed as a ham bird , and there have been plenty of those, yet another is being classed as 'an intruder'? Where should the line be drawn? I believe all University downlink only birds are intruders. They are all just YAUBs (yet another university bird).
What makes one YAUB downlink only bird a ham payload, and another one not? I just don't get it. They are all intruders IMO and don't do anything of interest to the vast majority of hams. FM and other modes are OK but DOKA-B is not? Why not? Perhaps becase a few people think so?

I'd also remind any group members following this thread that 70Cms is most assuredly not 'our' band, as suggested below. Never has been and is never likely to be. In most countries, the government / military are the primary users.
70Cms is favoured for big RADARs and tactical comms. Look up BMEWS, a Primary user, in the UK. We are Secondary users on 70Cms. Go check your schedule please. Since at least as far back as UoSAT1 (1981) , and probably earlier, the amateur satellite allocations from HF upwards have been seen as 'fair game' by the Universities. Nothing was done to remedy that situation at the time, their satellite sub-band use was not contested, so we are all at fault for sitting on the fence. Now is not a good time to complain. It's way too late for that.

73 Al.
GM1SXX
P.S. RAF Fylingdales also must rate as an 'intruder' on 70Cms. 2.5MW of RF feeding four steerable phased arrays of pawsey stub aerials covering 360 degrees of sky, transmitting on 420-460Megacycles.

Its easy to classify into Amateur Radio satellites and intruders.
HAM-satellites
has an open communication protocol and an usual modulation. Intruders has a
closed (secret) communication protocol and an unusual modulation. Such sats
also gets no amateur radio licence and a call sign.

Do you remember ? UO-11 is the oldest University sat in orbit and is active
again - ("YAUB").

DOKA-B is a closed comm. protocol. Is a demodulator and decoder freely
available ? I think NOT.

You are right Al. I knows of one country who the allocation 435-438 MHz is exclusively allocated for amateur radio satellites - Germany.

BUT ... It's never too late to complain. If all HAM organisations would complain against intruders now, in a few years our satellite band would be clean. But this requires our all efforts. But I think this will fail and all pessimists are right again.

Thomas,

DOKA-B or N is no protocol!

It□s a quasi-standard system consisting of antenna, transceiver and modem
and used by different universities of Russia.

The modulation of the data transmission is PM with Manchester-encoded data
on sidebands.

So DOKA uses 4800Bd data, one burst contains 256 frames with sync and frame
counter.

Frame length differs from satellite to satellite, however sync word is
always the same.

Data contains interleaved data, it's first and second part of a longer frame
send on even and odd numbered frames.

See here: http://www.dk3wn.info/p/?cat=17

4036. Yubileiny birds and DOKA-B

Yahoo group: eu-amsat
Date: 2010-12-07 19:03:35 UTC
From: Al
Topic: 4036 Message: 4036

Hi Group.

Officially, according to Reshetnev, the Doka-B consists of a 145Mhz receiver, 435Mhz downlink transmitter,onboard computer and the onboard navigation system. As such, it's a complete spacecraft control system. As Mike says, the downlink is Manchester coded, and as such is an open protocol that's in commonplace use in many fields of electronic communication. The DOKA-B system also controls the spacecraft temperature via a passive system. Think of DOKA-B as the equivalent of an Integrated Housekeeping Unit + Command TX and RX + navigation and thermal control, and you won't go far wrong.

The original Reshetnev press release for Yubileiny-1 is at...
http://observations.biz/Observations_from_Russia/m3-screen_en.pdf
and elsewhere.

I can't find anything about DARC having primary status on 70Cms. I always believed that Germany was in IARU R1. Perhaps someone can point me in the right direction please. I know there are minor variations in 70Cms priviledges but I can't find anything meaningful.
I keep going around in circles :-)

Unfortunately not as it's their band - they are the primary user plus of course the other MoD links dotted about 430-440MHz.

There are several similar 420MHz wideband radar systems in North America and one in the Pacific - the Ronald Reagan Ballistic Missile Defense Test Site at Kwajalein Atoll.

Thanks for the info on Yubileyniy 2 I was hoping for a linear transponder but it doesn't look like it is. Shame as it's going into a good orbit.

Gentlemen, this all is very interesting but will not change my message before. This Russian satellites with DOKA-B system are dangerous for our own true amateur radio satellites. What would you say when this satellites with their FM signal interfere with linear transponders from e.g. FUNsat, ARISSat and other coming linear sats ?

Hi Group.

Agreed it's a great shame that Yubileiny-2 won't carry a transponder, but why would it? It's not an amateur radio bird. It's a commercial /experimental /university 'downlink-only' bird.

With the shift from Analogue to Digital TV in many countries, the universities would probably have an excellent case for asking for a small piece of the spectrum that will be freed up as a result of the shift. Of course, that would require proper planning. Analogue UHF TV used a huge chunk of prime spectrum space, from 460-890Mhz. Perhaps now would be a good time for universities to seek a small chunk of that space, before too much of it gets re-allocated, rather than freeloading in the amateur radio satellite allocations.

As to Fylingdales being an 'intruder', I was of course joking. 70Cms is not 'our' band, as the poor people who often get locked out of their cars on the Fylingdales moors might know. Yes, motor car locking systems are also on 70Cms. Like us, car locking systems are also secondary users.

Have a good day folks.

4040. Yubileiny-2

Yahoo group: eu-amsat
Date: 2010-12-08 09:04:41 UTC
From: Al
Topic: 4040 Message: 4040

Hi group.

Yubileiny-2 will almost certainly be launched with Gonets-M3 & M4 birds from the 'Rainbow' launch complex LC-133 at Plesetsk using a Rockot KM vehicle as previously planned. LC-133 is a conventional launch-pad rather than a silo.
Rockot KM is a converted ICBM fitted with a Briz upper stage.

The Zarya website has the following info..
2011 Mar 16 Gonets M (x2) and Strela Launch
Rockot/Briz-KM, Plesetsk LC-133
Triplet of store/dump communications satellites - a Gonets M for the civilian system, and two are for the military/government system - Strela-3 and/or Strela-3M/Rodnik.
Postponed from 2010 December.

So, it looks like March 16th 2011 may be the launch date for Yubileiny. The postponement date matches the one I have.
This would be my 'best guess' for the launch date.

Topic: 4041 Message: 4041

Hi group,

The first two Colony 1 satellites are manifested for launch as secondary payloads on the second flight of the Falcon 9 rocket built by Space Exploration Technologies Corp. (SpaceX) of Hawthorne, Calif., Shultz said. SpaceX plans to launch the first Falcon 9 in May and the second later on this year. The second Falcon 9 flight's primary payload is SpaceX's Dragon capsule, which is designed to deliver cargo to the international space station. The flight also will carry two cubesats built by the Los Alamos National Laboratory and one built by the Army Space and Missile Defense Command.
Source... Hobbyspace.

I have not managed to find the frequencies yet. They don't seem to be listed in the IARU pages, so *maybe* they are using 70Cms or perhaps commercial frequencies.

Hello Al

This CubeSat was published first on AMSAT-BB. Mineo, JE9PEL, made
a website yesterday: http://www.ne.jp/asahi/hamradio/je9pel/caeruscs.htm

And yes, the frequency is not coordinated by IARU. Allow me the
question, do we need an IARU furthermore ? Today its more and more
important that the satellite branch of IARU makes Public Relations.
Many "Cubesat clubs" have no clue of such an organisation
(http://www.iaru.org/satellite/). They mean "Amateur radio ? Ah its
free!" and confound it with CB radio.

4043. Interesting Cubesat Snippet

Yahoo group: eu-amsat
Date: 2010-12-10 11:52:03 UTC
From: Al
Topic: 4043 Message: 4043

A little news snippet.

On the Dragon C-1 flight some Microsats were released from the second stage, but *not* as I believed into LEO.

>The second stage engine was reignited in orbit. This allowed the second stage to reach a height of 11,000 kilometres (6,800 mi). It then released several CubeSats, including a small satellite built by the United States Army.[9]

Now, this is a very interesting thing, because such an orbit could be very useful to AMSAT. Of course for a communications bird, something larger than a CUBESAT spaceframe would be very desirable. The MICROSAT format would be a far better thing.

Spacex also launched and retrieved a sizeable 'cheese wheel' with the Dragon Spacecraft. It was fitted into a specially made container. Something I think to do with Elon Musk beng a fan of the Monty Python TV series. (cheese shop sketch!) And no, I am not joking.
Spacex sent me the photos in an email message.

The US Army say SMDC-ONE is in LEO, predicting 30 days before it burns up in the atmosphere.

http://www.army.mil/-news/2010/12/08/49115-army-nanosatellite-on-first-flight/

But yes the HEO capability of Falcoln 9, mentioned at
http://www.southgatearc.org/news/december2010/falcon9_launch.htm
could be very useful. Particularly as Elon Musk indicated in an interview a willingness to fly Educational payloads on future missions.

A sat in that orbit is likely to use omni-directional antennas and clearly the path loss at that distance will be higher. However, this may mitigated by the use of 50MHz uplink and 29MHz downlink, with the sat generating 5-10 watts output and so as you say needing to be far larger than a CubeSat.

Hi Group.

Elsewhere, the reports for SMDC-ONE vary. For instance At skyrocket.de it's reported that the army expect a one year operating life for their triple CUBESAT.
This link also reports a longer life expectancy.
www.smdc.army.mil/FactSheets/SMDC-One.pdf
Meanwhile, Spacedaily reports an expected life of 30 days.
Which stories are correct? Ask me in 31 days time :-)

What makes me suspicious about the 30 day quote is the report that the second stage was boosted to a higher altitude before releasing the CUBESATs, although of course, one or more may have been ejected in the lower orbit. Also, I suspect the US army may not be too keen to dish out the real facts about their mission. May not be in their best interests.

>

Agreed, but I see only one fly in the ointment... no 50Mhz satellite allocation. At least, none that I could find. 50 up and 29 down would certainly be interesting though. Doppler would be very manageable. Might be a lot of fun.

I wonder.... are AMSAT transponder carrying satellites classed as 'educational'? I would hope so.

The kepler sets are available on Space-Track.org now. I have all sets loaded in my program and analysed it. It was not useful. The inclination is only 34.5 degrees and the ground track follows over the southern hemisphere. At my QTH JN47ck I see overflights in South (180?) with a maximum elevation of about 5 degrees. But I live behind a hill to South. South European stations may have more luck.

For a HEO orbit for P3E AMSAT-DL is in contact with SpaceX.

Hi group.
The US Military plan a cluster of 8 CUBESATS that can relay information.
http://www.ducommun.com/pdf/SMDC-ONEMediaDeck.pdf
A 30 day lifespan seems most unlikely to me, unless this particular bird, SMDC-ONE, was only a test article.
One thing is for sure. Spacex's Falcon9 launcher is capable of reaching useful orbital heights.

Yes, there was some issue when I was updating TLE's in orbitron some time back but after four attempts it got updated. Maybe some issue with the servers or latency with the internet connectivity at the last mile.

Thank's Mike

Batteries charging condition seems to be less than optimal if they are unable to sustain those small daily eclipse period +- 15 minutes per
hour!

As per this in May 2010: http://www.southgatearc.org/news/may2010/ao51_use_in_eclipse.htm could be AO-51 should be put on a kind of
scheduling like HO-68? or the satellite should be off for the early NA and SA morning pass as the satellite usage is very low.

As per the Space Quest web page their listed batteries products is BAT-4 Matched NiCd Flight Batteries (per cell) i don't know how the
memory effect is affecting them? By the way it seems finally that AO-51 was mainly commercially built! Another undisclosed (Or not too
disclosed) facts from AMSAT-NA!!! Could be that's the path to follow the various AMSAT'S should work as general contractor this will have
a very positive effect helping to get rid of some personal ego from some of those involved in the making of the amateur satellites ;) This
naturally take in account an ego issue among the satellite builders!

SpaceQuest's Contribution: The following Spacecraft products are implemented in the AO-51 bus:

* Battery Charge Regulator (BCR)
* UHF Hybrid Coupler (H-420)
* Flight Batteries (BAT-4)
* Integrated Flight Computer (IFC-1000)
* Programmable Permanent Magnet and Controller (PM-13)
* Triple Junction, GaAs Solar Panels

Just check: http://www.spacequest.com/success/echo.php

The Space Quest web page http://www.spacequest.com/about.php

Batteries are not equal but UO-11 is still working after all those years! What happen with our actual batteries? Are they manufactured is
some remote countries...

P.S. Did anyone ever hear about the Programmable Permanent Magnet and Controller (PM-13)?

4056. Spacex Falcon9 +PPOD launchers & GTO

Yahoo group: eu-amsat
Date: 2010-12-16 08:21:07 UTC
From: Al
Topic: 4056 Message: 4056

For anyone with an interest in the recent Falcon9 launch.

Spacex mounted three PPOD launchers inside the Falcon9 second stage. They can be seen in the photo with the Dragon spacecraft in the background.
Photo was taken from inside the second stage

http://groups.yahoo.com/group/eu-amsat/photos/album/952508366/pic/1116130930/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc

If the link doesn't work, please see photo in GM1SXX folder.

High contrast view of the Dragon spacecraft (circle at center) viewed from the top of the second stage as it departs over the curved horizon of the Earth. The rectangles indicate locations of three of the nano satellite deploying P-PODs carried on this mission. Photo Credit: SpaceX

After separation of the Dragon spacecraft, the second stage Merlin engine restarted, carrying the second stage to an altitude of 11,000 km (6,800 mi). While restart of the second stage engine was not a requirement for this mission (or any future missions to the ISS), it is important for future Geosynchronous Transfer Orbit (GTO) missions where customer payloads need to be positioned at a high altitude.

Shortly after separating from the second stage, the expected loss of signal occurred as the Dragon spacecraft passed over the horizon as viewed from the launch site We reacquired Dragon's video signal as expected as it passed over Hawaii, delivering the first ever video sent from Dragon on orbit.

Regards,
Al.

Hello Francisco

If you have a metallic boom you have to mount the antennas in 'X' form
to avoid a bad SWR and other bad effects. Otherwise you can mount it
in 'X' or '+' form.

If you want to operate also DX on 144 MHz or distant repeaters look
for a '+' mounting for horizontal and vertical polarisation.

Betreff: [eu-amsat] Tip on how to mount the antennas

Hello All,

Recently I□ve bought two new antennas from Wimo, the WX-220 for 2 m. and the WX-7036 for 70 cm. Looking for some info through internet while the package is arriving at my home I see that some people has mounted the WX-220 in □+□ (horizontal and vertical) mode like it is in the case of Mike DK3WN (http://www.dk3wn.info/antennen.shtml) and the 70 cms. Antenna crossed, and some other people like in the case of EA8BHH (http://www.antenna.wimo.de/album/ea8bhh.jpg) has the two antennas in crossed mode, so in your opinions how can I get better results?

Thanks in advance for your comments,

73 de EA1JM, Fran

You got the point but YOU can see it in your expected lifetime but many of us will not and as per the actual LEO satellite use it's not
with the new-comers flow that we will able to sustain a viable satellite crowd.

The AMSAT-DL P3E project is the only viable solution who can attract more people to the sat's world, failing to do so will only patch the
holes in the hull but sooner or later the hull will be empty of water...lacking of patchers...

IMHO this will not refrain me to wished you all a very merry christmas and please enjoy the following link but follow santa instructions
carefully don't make as usual and throw the instruction book away!

From: John Hackett
Topic: 4064 Message: 4064

After having read the HO-68 schedule whinging in 2010 I'd like to remind everyone that the world is split into different time zones - and that HO-68 encompasses the entire globe in the space of 90 minutes or so - (don't split hairs!).

IMHO, Alan Kung & Co do an excellent! job of giving everyone a fair crack at the whip.

RULE FOR 2011.

Think before you speak.

HO-68 was *NOT* designed to be anyone's personal satellite.

Wishing the entire group a Happy, properous and peaceful New Year.

4066. AMSAT-UK FUNcube SDR Dongle Video

Yahoo group: eu-amsat
Date: 2010-12-30 11:20:27 UTC
From: m5aka
Topic: 4066 Message: 4066

Henk, PA3GUO, has produced a HD video showing the AMSAT-UK FUNcube SDR dongle receiving signals from Amateur Radio satellites.

On the FUNcube Yahoo Group Henk writes:

YouTube video featuring the first results;
- HO68 CW
- HO68 FM
- AO51 FM
- VO52 SSB
- OOREOS 1k2 AX25 (packet radio with MixW)

Results are amazing. The FUNcubeDongle gives results similar to the Kenwood TS2000x.

Tests are done with the dongle straight out of the box, no tweaking.

Great achievement Howard & team !

Watch FUNcube Dongle: Out Of The Box test of this highly innovative SDR

http://www.youtube.com/watch?v=xFZGlqKPPQo
(HD video: set to 720p and Fullscreen)

Henk used a Mast Head pre-amp for the 2m and 70cm bands.

The FUNcube Software Defined Radio Dongle was originally developed for educational outreach as part of the ground segment for the FUNcube satellite. However it was realised it can be used for many other applications as well, so AMSAT-UK developed the Pro version which covers 64 to 1700 MHz and sells for around £125.

You can join the FUNcube Yahoo Group at

Hello Trevor and Group

This is really impressing. If I saw it correct, Henk connected the dongle directly to the antenna cable with a N-adapter I think. On the other side he connected the dongle with a A-A type M/F USB-cable to his PC. Very handy, so he has no cable losses to his PC.

(Aaahh... thats new: cable losses to the PC instead to the receiver. :-)

New Year´s Wishes

I wish you joy and happiness, even when conditions around us can get us down.

I wish you love and kindness, even in a world with so much hatred and brutality.

I wish you peace, even as wars rage.

I wish you justice, even amidst all the inequities.

I wish you reverence for the Earth, even as our governments fail to grapple with global warming.

I wish you a job you like, knowing that any job is hard to come by in this Great Recession.

I wish you good health, physical and mental, because the health care reform bill won´t guarantee it-not by a long shot.

I wish you enough food to live on, and good food at that. No one should go hungry in America-or anywhere else in the world, nor be deprived
of the pleasure of the palette.

I wish you time, that most precious resource, to enjoy art, music, poetry, literature, theater, nature, and to engage in sports not only as
a spectator but also as a participant.

I wish you an end to resentments and grudges, which are poisons we take in the hopes that our enemies will die.

I wish you-and all of us-an end to the wars and hatreds that roil the planet.

I posted this message to the EU-AMSAT YAHOO DISCUSSION GROUP too. Our Italian satellite op's friends will be inform (If it's not already
done) but amateur communications affairs are conducted differently in EU including Italy.
BTW could be Ruby can be of some help here:)

Hello and a Happy New Year

A local repeater with an output frequency between 145.800 and 146 MHz
violates the IARU 1 band plan. Any years ago a repeater in HB9 on
145.800 MHz had to be moved downwards because of interferences into

the satellite band.

There is no discussussion, IR0CK has to be switched off, until a new channel is coordinated by ARI.

4078. HO-68 comments.

Yahoo group: eu-amsat
Date: 2011-01-04 09:50:05 UTC
From: John Hackett
Topic: 4078 Message: 4078

Once again, I note the whinging about HO-68's orbit not being suitable for a particular station ... or two.

I'd like to remind the gentlemen concerned that HO-68's on time is NOT designed to favour one particular area. Please remember, it's a Chinese satellite and we should abide by and respect their decision of when to activate the transponder.

For my own use,the HO-68 late afternoon GMT 'on' times are optimum.

Conversly, I 'could' complain about the ISS orbit - (but I don't) -only 'seeing it at max 6 degrees for 90 seconds every 2 days - (read: unworkable from my QTH), dirro SO-50, AO-27 and VO-52.

What may be poor for one operator could be optimum for another.

Please remember, the world consists of more than The United States Of America and Southern Europe.

73 John. <la2qaa@...>

Topic: 4079 Message: 4079

Hello Dom,
You are of course right.

I have been in contact with Alan Kung regarding various aspects of HO-68 but as you correctly state,
The Chinese don't seen to want to share the workload.

I went as far as offering donations to help Amsat China but was politely refused (!) ... the implication being that subscriptions would require reciprocating with 'information' - (which was NOT my intention).

I think your comments will give people a better understanding of why the orbits are not always otimum
for certain times/areas.

73 John. <la2qaa@...>

CC'd to the group and the Amsat-bb for general information purposes.

Hi Domenico,

The approach is excellent, but you forget the first link in the chain.
HO-68 was built and funded all alone by the Chinese. So they can also decide
alone whether and how long they offer a service for other radio amateurs.

Each transponder operates on a schedule will omit any region in the world.
This is quite the same way with satellites which have an low inclination
orbit.

We are not entitled to the transponder but should be happy and grateful that
we can use it regularly. Unfortunately, the reality shows - if it is active
- it is far from optimal use ....

Hi John, LA2QAA

I don't agree with you because there are many and many HO-68 orbits with the satellite transponder OFF despite the elevation is very hight for South Europe and North Europe i.e. for you and for me as well for South USA and North USA

The problem is that in the above orbits HO-68 cannot be very well monitored by the only one command station in China and they prefere to switch OFF the transponder.

The pobleme is that the Chinese HO-68 should have more control stations around the the world instead of only one in China.The roule is that many control station are needed for a LEO satellites and only two or maximum tree for a HEO satellite.

Same problem arise with JAMSAT with only one control station in Japan for FO-29

AMSAT China and AMSAT Japan don't like to share the command of their satellites with AMSAT's command stations in different continents.

Conversly you should remember that in the early 1974 AMSAT had control stations for OSCAR-6 in USA ,in North Africa (Algeria) and Australia so that the satellite was continuously monitored and during all orbits it was operational.

I abandoned HO-68 for the better and reliable as well in all orbits available transponder of VO-52

Hello Roberto

Thanks for this translation. Let me repeat:

> The IARU is instead only a private association that enables a nation
> to join and has no legislative power, so it is impossible to the
> possible harmonization with other national associations.

This "Presidente" has not understood Amateur Radio as a self regulated
radio service.

Hello All

I'm also not always lucky with the schedule of HO-68. I saw many orbits with
a relatively high elevation and strong beacon signal. But the transponders
where switched off. I have accepted this situation with a shrug.

From Alan Kung I saw never an explanation why HO-68 has to be scheduled. Is
the reason of political or technical nature ?

By perusing the attached pic it *MAY* be possible to understand why I have a problem with VO-52
in this period of time - when the azimuth is behind those small obstacles. This also applies to AO-27,
SO-50 and The ISS.

The satellites that are! visible in this period of time are AO7, AO-51 and HO-68 for 2 passes a day ...
one optimum and one 'difficult'.

However ... looking on the bright side, the natural progression of the orbits ensures that in about 600 years time, AO-27, SO-50 and VO-52 will become visible from this QTH.

The above is only the start of the aerial woes at this new QTH.

Taking into account the fact that aerials are not allowed one has to improvise ... so I bolted an El-Cheapo
eotor on a stub mast 20cm from the wall of my ground floor flat (no attic!) and called it a TV aeial ...
which are! allowed.

The problem is ... I obviously can't turn the rotor more than 110 degrees - (because the aerial would hit the wall) - limiting my panorama even more.

I use an Elk log-periodic for TX (2m) and a homebrew 70cm yagi for RX on HO-68. My power varies between 200mW and 10 watts ... depending whether I want to work QRPp or QRO.

Serious operators will understand why I'm rather amused at the stations using 50 watts with 10 element beams and still !!! can't get into the satellite.

Please remember ... there usually *IS* somebody worse off than you are.

FB! Mike,
If you hear anything relavant, please post it to the group, I of course will do the same.

There are several scenarios that could be the cause but it's best *NOT* to speculate, so as not to instigate a load of speculative nonsense. You know how things are when passed by word of mouth between more than three people ...

"Send reinforcements, we're going to advance"

... very soon becomes ...

"Send three-and-fourpence, we're going to a dance"

Thanks again Mike.

Have a good day.

Group,
HO-68's transponder is back on after it's 'day off'.

I worked HA6NM with QRPp power on the 17:33Z pass.

"As we speak" I don't know why HO-68 took a day off work.

Yes in France as your PTT office does not permit DSTAR RF operation (Only one spot on earth BTW) as autopatch quite a set back for french
amateur but this is also another question as you said.

Sorry to disagree with you DSTAR IS amateur radio like it or not just see how many french DSTAR operators who communicate on belgium and
swiss DSTAR repeater my friend

And to make things worse it happens often on both side of a conflict. The present situation does not make an exception to the rule as per
some recent written exchange. There is place on this earth more prone to that kind of conflict and it often cultural but ITU region 1
2 meter band cover from 144mhz to 146mhz and region 2 144mhz to 148mhz 2 megahertz bandwidth instead of 4 in region 2.

This is not an excuse to anyone to go aside of establish band plan even if it's not regulated as here in Canada but a gentlemen agreement
is always better than none but as Florian Gabriel Yo9GJX wrote: "arogance and stupidity" will only lead to chaos.

Group,
I've just been looking at the Amsat-bb.

Following the gerneral concensus of opinion, interestingly ... the Americans are discovering and are starting to experience 'European' style operating on AO-51.

AaaaaaaaaaaaaWWWWWWWWWWWWllllllllllllllllllllllaaaaaaaaaaaa ... CQ SATELLITE, CQ SATELLITE,
CQ SARELLITE, CQ SATELLITE, CQ SATELLITE, CQ SATELLITE aaaaaaaaaaaawwwwwwwwwwwwlllaaaa (Blow) ... (blow) ... (blow) ... aaaaaaawwwwwwlllllaaaaaaaaaaa .... CQ SATELLITE, CQ SATELLITE ...

... on the top of ongoing QSO's.

Like the Americans themselves like to say ... "What goes around comes around".

Apparently, the editor of QST isn't interested in publishing a recommended operating proceedure.

Commander John Brannegan GM4IHJ warned us of the consequences of FM university 'me too!' sats in
1998. Almost nobody listened. We only have ourselves to blame.

Your average 12 year old girl on a mobile phone is a far! better 'operator' than most AO-51 aficiondos.

I fear the rot is irriversible.

I think it was Florian who said the greatest danger to amateur radio is amateur radio operators.

Oh uyou got that right mate.

73 John. <la2qaa@...>

As suggested in this article i send a copy of an e-mail i send to the Italian Canadian Ambassador in Ottawa. Could be ALL the international
AMSAT'S, ARISS association and amateur radio association (ARRL, REF, RAC etc) can do the same? It is not a question to interfere with any
Italian internal affairs but to demonstrate an international concern about Amateur radio Spectrum and making the world aware that the
amateur radio operator care about their frequencies and that they are seeking to have any international agreement respected.

This is something who should come out in the first place by those who are representing us and it is not too late to act.

Luc

The way to the Italian embassy is not the right one. The right one is via your national amateur radio association (RAC) and then IARU to ITU. The Italian ambassador has other political problems than amateur radio.

They are in CC too and we never know anyway i don't speculate on their agenda. and it seems the "offending" repeater is off the air for
now.

Sounds like AO-51 has been gaining in popularity in the States and the've now hit the same congestion problems and consequent behaviour that Europe has had.

It's all because single channel sats can only handle a very limited number of users in their footprint. It's why I prefer Linear Tranponders.

Group,
Something every satellite operator should read, digest ... and understand!.

Particularly the paragraph about not being long-winded and 'hogging' it.

Maybe those 2 x Russian 'regulars' will realise that AO-51 is *NOT* their personal local repeater.

While English is little used in Russia, most Russiand *DO* speak und understand the language so that's *NOT* really a barrier. RA3XL speaks better English than me! - and I'm from Manchester.

Just because the satellite footprint is over 'Mother' Russia at times ... the rest of Europe is usually covered too. Most operators are not !!! interested that you're visiting your great Aunt ... or the colour of your socks on Tuesdays - so keep it short and give others a chance ... please!.

Topic: 4112 Message: 4112

Group,
While I specifically mentioned Russians in my last posting ... my comments apply equally well to Italians, German, French, English and any other nationalities in Europe. My comments were *NOT* aimed at any particular nationality ... but were! directed at two particular stations who tend to 'hog' it on every workable pass.

The other point is phonetics ... by trying to be 'clever' and using "Charlie, Lima, Oscar, Whisky, November
on the first call - then Cheese, Lettuce, Orange, Wimp, Novosibirsk on the next over *ONLY* causes confusion, requesting a repeat, wasting time ... so please. let's 'NOT' try to be 'clever'' and lets instead use the international phonetic alphabet when necessay to pass callsigns.

Work the good operators, ignore the alligators and clowns.

The idiot with the cow noises is part of the game - just ignore him. He's looking for attention.
Ignore him and he *WILL* get tired of it and go away ... trust me.

Group,
"As we speak", 110120102120Z, there's no word from Camsat as to why the HO-68 transponder resembles a Great Britain 1960's TUC 'working week' ... that is to say, off sick ... strike brothers! ... not at work for any number of reasons ...

As a matter of fact, information in general from the Camsat team appears to be TOP SECRET ... that is to say, they're not sharing it with the rest of the amateur satellite community - despite continued requests.

I was asked to supply information from Europe ... all I can tell you is that the information sharing
is *NOT* reciprocal.

4116. Operating proceedure.

Yahoo group: eu-amsat
Date: 2011-01-12 20:47:43 UTC
From: John Hackett
Topic: 4112 Message: 4116

Hello Luc,
Well, it sounds rather like a cow having a calf ... arrrggghh ... moooooooo .... ooooooooh.

I'd guess it's deliberate because a 3 year old could tune a radio in half! the time.

It could of course be one of those operators with no receive aerial.

Being serious for a moment, the problem stems from the higher power on AO-51, people than can't usually hear the satellite suddenly can! - and they use their HF techniques (MORE POWER! EGON)
without being able to hear themselves. Some of them don't even know! they're QRM'ing other operators because they don't understand the FULL DUPLEX principle - being only used to their local
50 - 100w repeater on VHF.

As was recently noted on the Amsat-bb ... even the editor of QST wasn't interested in publishing an
operating proceedure guide for satellite operating.

I requested that Amsat-NA and Amsat-UK publish a recommended operating proceedure way back in the 1990's ... nothing ever appeared. GM1SXX and myself did donate a booklet we wrote to Amsat-UK
but it was never promoted.

There has been an FM satellite guide from a well known Australian Ham, here on the internet but
in the last 15 years I've only ever seen it referred to once ... and that *WASN'T* by Amsat.

One would think that anyone trying a new mode would do a little research and read up on the subject ... but that's probably too much to ask in these 'tick-box' society days of falling standards.

If Amsat themselves don't produce a recommended operating guide for newcomers - it's highly unlikely anyone else will bother.

THUD! ... (falls off soapbox).

Hi John

First a link to hear in the first place.... http://www.youtube.com/watch?v=XAYhNHhxN0A

Second always make SPYBOT running and make frequent spyware bank update (I just discover than my last update date back 3 months!)

Third never have any address book!!!! There is no other safe solution BUT MANY WILL DISAGREE HERE AS ON TROJAN TOO!!!!

Fourth use PEGASUS MAIL as your e-mail software NEVER BEEN COMPROMIZED YET!!! but again http://www.youtube.com/watch?v=XAYhNHhxN0A
BUT BUT BUTTS...?

Fifth FOOL ME OUNCE SHAME ON ME and you know the rest but you have to know the source and again! http://www.youtube.com/watch?v=XAYhNHhxN0A

AHHHHHH ANOTHER NEWBIE.....JOKE ;)

There was a perfect storm but no perfect solution...

P.S. try as possible as possible to hide your CC

And the last solution: http://www.trojan.ca/en/home/ and again it's not fool proof...

4128. Playing the game ...

Yahoo group: eu-amsat
Date: 2011-01-14 13:56:00 UTC
From: John Hackett
Topic: 4128 Message: 4128

On the 14:36 UTC pass of AO-51 there was a German and an English QRP station attempting to make a contact but couldn't get through the Russian *net* ... where the one station passed it to
another station (without pausing to listen).

C'mon! gentlemen, this is *NOT* playing the game. A good operator LISTENS occasionally ... a good
operator gives the QRP stations a chance sometimes.

The stations I refer to were in QSO yesterday ... the day before ... and the day before that ...

Ohh ... of course !!! ... coincidence! ... yes, I should have known ... but why is it necessary to call the
same station everyday ??.

73 John. <la2qaa@...>

Hi,

Do these Russian 'gentleman' have callsigns by any chance? If so, I'd suggest sending them some appropriate literature on proper operating procedure. This might just do the trick.
Just my 0.2Pence-worth.
Perhaps even an invite to join this group could be productive.
AO51 is completely unsuitable for rag-chewing.

Hello Group!
I like when all "gentlemen" who speak in Russian language call Russian.
But the problem is not in body color/language style/QRA loc or anybody else.
If you have G5500, for example, and 9 el switching pol yagi - you can heard all from 0 degree. But, how much stations use it? When you work HT with rubber will you heard full pass? Again, if you have G5500 and good antenna, but you in the bad environment (city or other qrm) - can you heard all pass? My answer is NO.
Duplex will save the World... and Peace on FM-sat.

73! Igor, RW3XL

Gentlemen

There are also Russian people with Chinese long range telephones in
the uplink of AO-51 !

I'm listening every weekend to AO-51, our Russian colleagues has a
good operating practice. I don't make a list of bad operators here,
you can listen yourself.

In my humble opinion, you have a RAT (http://rapidguide.blogspot.com/search/label/Rats)
It grab your emails, messenger for adress list and send data to a server, also is multiply and auto send to your friends. The goal is to grab how many email adresses he can for SPAM .
You must search in your computer a file with a name like " server.exe " and deleted.

http://www.exterminate-it.com/malpedia/remove-http-rat

http://securityxploded.com/

If not scan your computer online with online antivirus scanners.

http://www.bitdefender.ro/scanner/online/free.html

If is not working reinstall your windows and learn how to really secure your computer

http://www.insecurity.ro/

For anyone considering this route, please be a little bit careful. Please read this page first.

http://www.file.net/process/server.exe.html
Your server.exe file may not be malware!
I would also point out that most antivirus programs do not find and eradicate malware. You need a different software tool for that.
Spyware Search & Destroy is one that I use. (free for non-commercial use).
The Microsoft Malware Removal Tool is another. Available at www.microsoft.com
Malware and Spambots often need separate software for identification and eradication.

From: John Hackett
Topic: 4134 Message: 4134

Group,
I agree with GM1SXX. Some Malware and SPAM files are *NOT* detected by certain anti-virus programs but *ARE* detected and deleted SPYBOT SEARCH & DESTROY ... (FREE).

By the way ...

For those thinking that my recent remarks about AO-51 operating were an exclusive attack on Russian stations, I can assure you they were most definately *NOT*.

In earlier posts from me one can read my praise of the general standard of operating by Russian stations.

I''m sorry to say, we lost another member of the group this week ... but on the other hand, we did gain four new members.

LOOK AT US !!! ...

We now have just over half the number of members of Amsat-UK ... not bad for a splinter group.

4135. Re HO-68

Yahoo group: eu-amsat
Date: 2011-01-15 14:54:48 UTC
From: John Hackett
Topic: 4135 Message: 4135

In this week I received many reports from all over the world about faults of HO-68 telemetry beacon. After we analyzed situation of the satellite, we think that the software of payload management MPU was not running properly, the communication of onboard data bus between payload management MPU and the satellite management unit was stopped because of the software crashes. It led to the beacon problem and abnormal switch of transponder.

Today we switched the satellite into safety mode at 0300Z , turn off most of onboard units, and then we re-powered up at 0440Z, the satellite was back to normal operating mode, so far the beacon operates normally.

We will not upload command to the satellite for transponder operating skeds of next week, we will monitor continually in next week. Please send your report if you find any abnormal operation of HO-68.

Hi all,

I've started using Orbitron but when I update TLEs via "Space Track", using the Amateur Radio option, there are few active amateur sats listed.

How do I get a comprehensive set of current amateur satellites into Orbitron please.

Any suggestions would be most welcome.

Thanks,

73 de Phil G3XAP

From: LA2MOA
Topic: 3355 Message: 4141

Group,

I was monitoring the HO-68 beacon at 0914Z when the bird had a nice passage over EU. Here's what I received:

BJ1SA XW XW AAA TTT AAN TDT ETT TTT TTT TTT TTT TTT TTT TTT TTN XW XW

I also tried the linear transponder, which was somewhat operational. Wasn't that lucky on SSB - whatever I tried on the uplink, came back on the downling "Donald Duck:ish".

LSB up - USB down = Donald Duck
USB up - LSB down = Donald Duck
USB up - USB down = Donald Duck
LSB up - LSB down = Donald Duck

CW worked better, of course. Was calling CQ for a while, but no takers.

Next passage over EU is around 11Z, and I hope as many as possible will monitor the bird - both the linear and the FM transponder.

Anyone who has contact with Alan Kung may pass on this report to him.

> I was monitoring the HO-68 beacon at 0914Z when the bird had a nice passage over EU. Here's what I received:
>
> BJ1SA XW XW AAA TTT AAN TDT ETT TTT TTT TTT TTT TTT TTT TTT TTN XW XW
>

'AAA TTT' after 'XW XW' means that only the beacon is active.

> I also tried the linear transponder, which was somewhat operational. Wasn't that lucky on SSB - whatever I tried on the uplink, came back on the downling "Donald Duck:ish".

>

I think you heard yourself. Check your coax cables and antennas again.

> Next passage over EU is around 11Z, and I hope as many as possible will monitor the bird - both the linear and the FM transponder.
>

If you monitor the beacon, look at this:

```
Call ID ID Ch1 Ch2
-------------------
BJ1SA XW XW AAA TTT -> only beacon
BJ1SA XW XW TTT TTA -> beacon + Lineartransponder
BJ1SA XW XW TTT TAT -> beacon + FM-Repeater
BJ1SA XW XW TTT ATT -> beacon + Software Upload
```

Hi John,

Thank you very much for your report!

This week HO-68 transponder will not be turn on, we
will see if beacon can work
steadily. we are going to test transponder at this
weekend.

73!

Well congratulations !!! Nick,
I would have thought that an English speaking station would have managed
to figured out from Alan's (the control station) message that he meant the transponder was
closed for general use, while they ran the beacon tests ... but apparently not.

NB.

Don't shoot the messenger.

If you actually 'read' the thread there's a possiblility you might understand my original
post.

Yahoo group: eu-amsat
Date: 2011-01-19 19:16:40 UTC
From: John Hackett
Topic: 4153 Message: 4153

Hello All,

HO-68 linear transponder(CW/SSB mode) will be turned on from 01:10 UTC to 03:00 UTC on 20th January.

If you hear any signal, whether beacon or downlink of the transponder, please let me know.

73!

From: Francisco Jiménez-Martín Sánchez
Topic: 4158 Message: 4158

Hello,

I☐m thinking in buying a 1200 antenna and apart from the wimo store, I☐m not able to find any for my icom 910h. Can you advise me one based on your experiences with ao-51? Nowadays I have the smallest from wimo, the helix 23 and with it I have made voice qsos on AO-51, but I☐ve never reached the sat on 9600 packet or even I☐ve never been digipeated through CO-65, so any recommendation is welcome.

Hello Francisco

The AO-51 digipeater has an opposite polarisation, LHCP. Try with
cross yagi's or loop yagi's or what else.

For CO-65 you need a GMSK modem. Mineo, JE9PEL, has built one. But I
think in Europe nobody is QRV via CO-65.

A bit confused here is it ARISSat-1 or Kedr?

"satellite Kedr was accommodated in the vehicle cargo compartment on January 18"

"Its name is accepted by call sign Kedr of the first cosmonaut of the Earth - our compatriot Yu.A. Gagarin. Yu.A. Gagarin had this call
sign when he performed his flight onboard manned spacecraft Vostok."

Thank's for any precision!

"you may as well use Skype..."

You can add also MSN chat, Twitter, Face Book all are related to the internet and many Hams leave amateur radio and they are now on the
internet.

On a LEO sat with a 10 minute window you are normally restrain to this kind of exchange and also here you can add "MY GRID IS XX##ZZ PLEASE
GIVE ME YOUR GRID" On some occasion you can have a less crowded pass usually the very early one 0300 to 0600 am but there is a catch 22
here you are often alone on the birds with the exception of those who are living on the north eastern coast of North America who can reach
europe or those who can use AO-7

There is here a GRID frenzy with not some DXpedition but Girdexpedition. A new trend who was not there in the AO-40 era as the demand was
not there at that time.

The focus put on KISS station in a way to recruit new satellite operator is not bad if this new operator goes beyond his KISS station IMHO.

What is the motivation for some to operate on LEO satellite? The "exotic" mode and bands? The pleasure to achieve an OSCAR class station?

There is one thing the internet cannot provided "exoticism" be able to feel something and being able to have a direct relation with
something we build and something we can directly use and watch performing at the same time.

There is new modes actually growing DSTAR, DRM, DIGITAL VOICE (FDMDV) is this can be an alternative to those who wants something else? or
will we be facing with this alternative, overcrowded single channel satellite pass? Where is the place for experimenting on the actual LEO
fleet? Our licence was not created for "experimenting"?

Gordon your "you may as well use Skype..." take now a new sense not a non sense!

P.S. i'm on skype and DSATR on VE2FCT repeater and on reflector REF016 B when the repeater is "busy" i just make a mobile QSO last Sunday
with Gerard PA1AT with a 599 Q5 signal on DSTAR If communicating is the goal there is a way to mixed internet with the radio Is this is
possible on the satellite YES on AO-27 and possibly on some other sat commanding team wise...

From: John Hackett
Topic: 4165 Message: 4166

On AO-10, AO-13, AO-40 and AO-7 - (up until 'FM' style operating took over) - we actually conversed !!!!
on the satellite.

Imagine that !!! ... actually *COMMUNICATING* with somebody ... but alas, these days are over and the
new generation can 'progress' with their ... "599 OM but your signal is very weak".

I hope the planned OUFTI-1 dedicated D-Star satellite will get us back to innovation - as opposed to a
bunch of sheep emulating operating on a terrestial repeater.

Full duplex? ... what the eff is that ??.

From: John Hackett
Topic: 4167 Message: 4167

I wonder if anyone else noticed the paradox on the amsat-bb this morning.

Among several mails illustrating the atrocious behaviour and operating on AO-51 was a mail re: the
Arissat ... (and I quote) ... "a pity that this is a SSB satellite" ...

Think! about it.

Of course, the criticism of the FM satellites was immediately quashed by a prominent member of the b.o.d. whom also ridiculed the comment of the gentleman who mentioned he'd like a 2m up 10m down satellite.

Looks like an *OPINION* is now taboo on the Amsat-bb ... at least one that disagrees with the official party line.

I always thought the 2up / 10 down birds were the most fun of all. What a pity we don't have any now. They could be worked with very modest equipment. They must have helped sell a good few FT-290 Mark1's, while nearly everyone had a radio that covered the 10 downlink. What could be possibly be ridiculous about birds that provided so much fun for multiple users on CW/SSB? There's nothing watsoever ridiculous about that IMO.

And yes, I do understand some of the technical arguments against using 2-10M but those arguments didn't detract the excellent fun element of these birds.

Al, we have AO-7. Its 2m/10m transponder is on every 2nd day.
I think you are aware of it.

> They could be worked with very modest equipment. They must have helped sell a good few FT-290 Mark1's, while nearly everyone had a radio that covered the 10 downlink.

My Rig is a Ranger RCI-2950DX with a Lambda 1/2 inverted V dipole.
If the 10m band is open via Es I can also work nearly whole Europe.
On this way I met many OM who is also QRV via satellites.

>
> What could be possibly be ridiculous about birds that provided so much fun for multiple users on CW/SSB? There's nothing watsoever ridiculous about that IMO.
>

I'm QRV on both, FM and SSB sat's (not birds, I'm not a ornithologist).
The chaos on AO-51 has increased massive so I have no chance to operate
it any more. My last QSO was at 19 December. The LEO SSB sat's are more
difficult to work because of the rapid Doppler shift. But yes, its more
fun than to chat via FM.

HEY!! We HAMs are experimenters and not CBers! When I read the "-BB"
often I think the opposite.

Hi Thomas and group. I certainly am aware of it, having spent quite a long time copying data from it, after it came back from the dead, in addition writing software to decode and analyse that data. LA2QAA and myself discovered quite a bit about AO7 that wasn't in the documentation, by analysing that data.

So no Thomas, I hadn't forgotten about the ailing AO7 which only provides limited QRP type working with decent aerial systems. I agree that this was totally my fault completely for for not explicitly mentioning that I was intending good 'fully-functioning birds', and not single a badly ailing one.

It's one thing to work AO7 with appropriate equipment and power levels but quite another to work a bird (or several birds) with superbly sensitive receivers and strong downlinks that could be copied using nothing more than a simple wire aerials fashioned from scrap wire.

Agreed A07 is still *partially* functional and can be fun, not to mention extremely educational, but I had really intended 'genuine Mode-A easysat communication for multiple users' on the same bird using commonly available low cost ground equipment. We had that once, and it was a load of fun, but it's been forgotten in favour of other things.

And yes, I do understand the technical arguments against using Mode A, but lets not lose sight of the fact that-

1)despite the technical case against it, it works.
and
2)Mode-A did allow very easy communication for multiple users with commonly available radio amateur equipment and very basic radio aerials.

If anyone thinks that's somehow ridiculous, I suggest they read some history or talk to people who used these Mode A birds. You may just come away with a different view.

"Communication". By communication I mean a proper and relaxed QSO rather than just a quick exchange of callsigns. YMMV.

This can't be done on AO7 with basic equipment and small antenna systems. The bird is way too far degraded. I meant properly functioning MODE-A birds.

Have a good day.

Hello Al

We have the same meaning. But for such nice QSO's eg. with Hawaii or Japan we have to wait for P3E. I have no experience with other Mode-A sat's, AO-7 is my first one. On the ISS it's theoretically possible to work in Mode-A with their Kenwood TRX. But the ISS is not a satellite.

Have also a good day.

Hi Thomas and Group

I have a completely different take on things. Life is too short to wait. We are alll getting older, and at a worrying rate :-) When I joined AMSAT, I had teeth and waist-length hair and very little money. These days, I still have (some) teeth, and little money, but virtually no hair. What small amount of hair I do have left is a pleasant enough shade of grey, so that's a positive thing. In all of that time, over half of my life to date, there have only been a few Molniyas, with a somewhat mixed track record. They never interested me much. Yes, you can surely work DX on them, but from an operating point of view, they are pretty boring. I much prefer the action needed to chase a fast moving LEO, by hand, *without* all the modern frills such as computers and Doppler/correction and aerial pointing that detract from the fun element of needing several extra hands.

While launch costs continue to escalate. Molniya's are no longer financially viable (Unless someone generous donates a very large lottery win, of course) and so I for one would rather see simple useful low-tech (relatively) birds in LEO (800-1000KMS) with *linear* transponders for fun, while using HF radio for DX. At home I continue to make many HF PSK & SSB contacts using a ancient hybrid (transistor/valve) radio made in the 1980's and partnered with a plastic fishing-rod antenna in my miniscule garden. I spend hours every day, morning and night on the air. It's a whole load of fun, operating from what most people would consider to be a totally useless location. I've worked over 6000 miles running 40W or less (usually less, and often much less) power with this very simple, cheap, and restricted, radio system. I already have DX, via the ionosphere. When I replace the fishing-pole with something a little bit better, I should get out further. Not having a Molniya in orbit is absolutely not a an issue for me, although of course, it probably is for others.

I keep reading that we all *need* another Molniya. Wrong! I don't, and I suspect many others also don't. There should be something for everyone in our amateur radio hobby and compromise is inevitable. We all need to stop beating ourselves up over launch costs and adapt to change, or fall by the wayside. We cannot change the financial reality. The sooner we accept this, the less painful the transition will be.

As for the ISS, technically it is indeed a satellite, the largest artificial satellite of planet Earth, and I believe it even carries radios, but I do take your point. Not very exciting and in a poor orbital inclination and poor orbital altitude for many people.

From: John Hackett
Topic: 4167 Message: 4173

My views on the satellite scene - particularly, the standard of operating - are fairly well known.

I agree with GM1SXX on most points re: HEO v LEO . I've operated a fully automated station on several of the previous HEO satellites. I found them quite *BORING* after a couple of same old, same old qso's.

For me, too predictable = *BORING*.

Quite a few of today's operators have never used an HEO.

The most fun I'ver had on satellites was on RS-10. (LEO).

The most 'interesting' was also on RS-10 ... using the ROBOT for propagation studies.

My favourite 'chat' satellite was FO-20 (SSB) ... which also provided the distance record for an LEO ...
Norway to Japan - 1 degree elevation at both ends of the link.

I also had daily skeds with Eagle River, Alaska - (QSL's on OBSERVATIONS) - on FO-20 using just
25w EIRP.

HF.

I've worked well over 300 - (coumntries, not stations) - including the elusive Christmas Island and most countries on the African continent - thanks to some Japanese DX'er - so I have enough 'wallpaper' to re-wallpaper the Mocba Metro ... though of course, I wouldn't cover up that beautiful mosaic ... now
that's !!!! art, folks.

OK !!! ... IOTA 36 *DID* help. Until I taught a couple of NOGS I was the only amateur on the island.

I currently live on IOTA 56 - which is crawling !!! with radio amateurs ... (3).

The ISS.

Unworkable from my QTH - I'm too far north. Ditto AO-27 otherwise I'd be using D-Star.

OK Al, then we have not the same meaning :-) If you want action and a nice QSO you can do it, when AO-51's second (QRP) repeater is switched on and all other OM's are on the main repeater. Or Mode L/US is switched on. AO-51 is no bad satellite if all repeaters works well. But now it is in eclipses and its batteries are old.

A satellite with a mode-A transponder may be a solution. But the time of the Russian Radio Sputniks is definitively over.

Yes, the waiting for P3E is a problem. Many OM's have sold their P3 rig and antennas. P3E should be in orbit and active. But nobody have foreseen the financial problems which had arisen.

Yes, I think we AMSAT-DL members have to thinking over "what comes after P3E ?"
I prefer fun DX like in the AO-10/13 days.

The financial reality is accepted. I think, P3E will be the last P3-satellite
which will go into a HEO (hopefully). Or we find a generous billionaire. :-)

Hi Al,

I believe more Amateur HEO's will acheivable in the future, but not only HEO's also LEO's with an apogee of 800-1500km.

Different AMSAT groups around the world are working on projects that ensure we will have both in the future so there Will be something for everyone.

I like many others still long for a new 145/29MHz sat but maybe even better would be a 50/29MHz sat? Lower path loss on 50MHz.

The ARISSat-1 satellite, due for deployment Feb 16, should be very good for low power SSB / CW working, granted it probably won't be usable above about 60 degrees latitude North or South but for 99% of the Amateur world it should be a very useful QRP comunications satellite.

I believe this band pairing has been brought up before. A very interesting idea Trevor, but with two possible flies in the ointment.

On 50Mhz it would probably end up as another FM bird, to suit the commonly available radios, rather than the practical aspects of communication.
and
I don't think 50Mhz has a space segment allocated.

Nice idea though. As for more Molniya launches, I think time will tell.

But almost every HF rig has 50MHz in it these days so there's plenty of SSB/CW equipment. In fact I'm hard pushed to think of more than two 50MHz rigs that are FM only.

> I don't think 50Mhz has a space segment allocated.

Currently it doesn't but IARU are pressing for it, see page 26 of http://www.iaru.org/ac-09spec.pdf

Arguably an Uplink could be acheived now but it would be down to local agreements with national regulators rather than being generally available. In much the same way that individual national regulators permit the use of the 432MHz uplink for Oscar-7 despite it not being an Amateur Satellite allocation.

I think 50MHz with it's lower path loss will prove to be very good band for low power CW / SSB satellite contacts.

From: ei4htm0giw
Topic: 4183 Message: 4183

Hi All

As it my first post to the Group, Hello !

Just wondering if anyone has had any success using Satpc32 with Supercontrol for the FT-847

I remotely operate my FT-847 and use Satpc 32 for doppler with EA4TX for Antennas, and audio via Skype or IP sound.

Id like to have more control of the FT847 using Supercontrol but would still like to use The Satpc32 and EA4TX for doppler and antennas.

Anyone out there doing this ?

Regards

Dave

4189. ARISSat-1 Reception Challenge

Yahoo group: eu-amsat
Date: 2011-02-11 13:30:16 UTC
From: Trevor .
Topic: 4189 Message: 4189

AMSAT-UK has announced a ARISSat-1 reception challenge with a FUN reward. The different categories cover those with or without a FUNcube SDR dongle.

ARISSat-1 is scheduled for deployment from the ISS next Wednesday, 16 February. The expected signal levels from ARISSat-1 should be similar to those expected from the AMSAT-UK FUNcube and the team are keen to discover what will be the minimum and best type of antennas for schools to use.

Full details at
http://www.uk.amsat.org/content/view/735/68/

4190. ARISSat-1

Yahoo group: eu-amsat
Date: 2011-02-11 13:47:19 UTC
From: John Hackett
Topic: 4189 Message: 4190

ARISSat will always be below my horizon so it's a non-starter for me.

If the world were flat, I would see an occasional 2 degrees elevation - but it's not - so I wont.

Mountain peaks in Norway (depending how near you are to the base) can be 18 degrees elevation.

Ask Pythagorus ... 540 BC.

The square on the hypotenuse is equal to the square of the sum of the other two sides.

NB.

Why the ISS isn't 'crawling' with Norwegians.

It has more do do with geography and orbits rather than idle LA stations.

Luc, be careful about such emails. It remembers me about the African
spam mails. If anybody has an inheritable sum of 20 million USD his
attorney will contact the lucky organisation direct.

Satellites are certainly challenging when you get that far North. I'm just grateful that NASA didn't put the Space Station into the 29 degree orbit that they were originally thinking of doing in the 1990's. That would have put most of Europe out of range.

The 56 degrees comes from the Russian influence - MIR.

I suspect somebody will make available a Web tuneable SDR covering 145.9-145.996MHz.

Again! an excellent one from VE ...

Hi Luc,
Unfortunately, after 4 x heart attacks, a duff lung and a gammy foot - there's no way! this 'old goat' could manage to climb 6000 meters of solid ice ... so ARISSat is still !!! a non-starter for me.

Anybody got a spare Sea king ??.

RGR Trevor,
I'm pretty sure me' old mucker Mike (DK3WN) will do it.

The last time I mentioned the ISS was unworkable from my QTH I was flamed by a prominent member from Stateside ... he'd checked my locator and could 'see' that I could work the ISS at 2 degrees
elevation ...

I didn't have the heart to explain to him that unlike some US states, Norway is *NOT* flat.

(To be truthful, I was just too idle!).

Just hope it will not be any QRM issue on their numerous radio system inside ISS as there is a strong possibility that some QRM issues
appears during the ARISSat 1 testing due to the close proximity between the radio systems aboard and ARISSat 1.

Someone could be suggested to investigate more before realeasing the cube sat?

4200. First Call for Speakers for AMSAT UK Colloquium 2011

Yahoo group: eu-amsat
Date: 2011-02-12 20:18:44 UTC
From: David Johnson
Topic: 4200 Message: 4200

Hi All,

This is the first call for speakers for the AMSAT-UK Colloquium 2011
which will be held at the Holiday Inn, Guildford, UK
(same venue as in 2010) from *Fri 29 Jul to Sun 31 July 2011*

AMSAT-UK invite speakers, about amateur radio, space and associated
activities, for this event.

Offers of talks should be sent *ONLY* to G4DPZ, via the following routes:

e-mail: david.johnson AT blackpepper.co.uk

SnailMail: QTHR from www.QRZ.com

AMSAT-UK also invite anyone with requests for Program Topics to submit
them as soon as possible to G4DPZ. Invitations for specific subjects will
be included in the future call.

Likewise if anyone knows of a good speaker, please send contact and other
information to G4DPZ.

73

Dave
G4DPZ

4201. SAT Transverter tuning problem - suggestions welcome!

Yahoo group: eu-amsat
Date: 2011-02-14 18:55:18 UTC
From: i4mfa
Topic: 4201 Message: 4201

I got a 2nd hand Microwave Modules MMT 144/28 from a USA ham and I changed xtal (new is 116MHz) in order to usr it from 28-30 upTo 144-146 (and downTo) for satellite. Without testing it before I put up the new xtal and started tuning at 145.900 (0.1W input 29.900 from FT817ND modified) for max output (directly on 2x11 yagi, 1.3 SWR) on my LDG DWM-4 Wattmeter but, even if I see 10W to 17W (FT817ND is 2.5W max on my LDG), REAL LIFE report of my xverter signal is lower respect 0.1W from FT817ND.
I performed the following tests.
1. fine tuning of oscillator coil, listened on FT817ND (real life test reports OK)
2a. max output on LDG wattmeter connected to my yagi
2b. max readout on my Heathkit Dip Meter (2 turns on SO239 wire from PA, twisted wire, 2 turns on GDM coil) at "expected" frequency 146MHz (to be honest I have a 5Mhz precision on my GDM)
2c. max S readout on a FM handheld in my shack (yagis are on the roof, less than 10' far), 1" wire antenna on it (max S readout IS NOT max output on LDG wattmeter: sound strange to me)
3. compared test using the same cable + yagi of FT817ND (146 MHz) and transverter

Test 3 evidence LESS THAN 0.1W at 146 MHx even with a wattmeter readout of 10-17W (either FM or SSB; modulation is excellent from xverter, signal is looooow).
I receive on a FT1000MP MarkV Field; secondary receiver (tested on FM) signals seems goods, primary receiver (tested on SSB) seems better, both receiving tests compared good respect FT817ND.

All 2x tests have been done as follows:
A. starting from max attenuation, reduced attenuation and measured output till flat; slightly increased attenuation.
B. tuned mixer stage for max output
C. starting from last (antenna side) circuit of xverter, tined the capacitors only for max (see 2a 2b 2c for definition of WHICH max).

I am going crazy, any suggestion welcome.
73s, Marco I4MFA

>

Hello Marco

I don't know if I understood you correct. At the backend of the transverter
you will have the power to drive an additional PA. If you measure 2.5 Watt
its OK I think.

> I don't know if I understood you correct.

Tnx Thomas fer re. I a few words: when I connect the xverter to wattmeter I read 10-17W, when I connect FT817ND (146MHz) I read 2.5W BUT all the stations receive my signal 10 times stronger; so the 10-17W reading of the xverter produces a 0.1W REAL SIGNAL (with excellent modulation, but... milliwatts). Same cable, antenna, meter etc.

If somebody else wrote this down to me I'll reputate him crazy; unfortunately I know I am not crazy, that's why I'm going to be crazy!

Testing suggestions?

Hmmmm.... I understood this situation:

/FT817ND/ --(2.5W)--> /xverter/ -->(10-17W)&(0.1W)

If you drive the transverter with 2.5 Watt then the output of 10-17W
is for the antenna and the 100 mW could be for test purposes or another
microwave stage. With 100 mW you will never get a higher signal level
than with 17 Watt. This is physically impossible.

The previously scheduled task of deploying the "Kedr" microsatellite had already been cancelled, due to the fact that, if it were deployed
EVA-28, Kedr´s batteries would run out before the 50th Anniversary of Yuri Gagarin´s spaceflight, which the satellite is designed to
commemorate. Instead, the satellite will be switched on inside the ISS on 12th April.

Finally we will get to the bottom of it!!! A satellite inside a satellite who will never fly??? that remembers me the famous TV series
"Voyage to the bottom of the sea" Where incredible things happens inside this nuclear sub.

Could be some spare batteries can be shipped up there in a way to have ARRisat-1 finally flying by himself?

http://en.wikipedia.org/wiki/Voyage_to_the_Bottom_of_the_Sea_%28TV_series%29

P.S. One of many plastic glue kit i assemble without sniffing too much the glue vapour on purpose... Other purpose for this glue has been
discovered years later!

4207. Ariane V ans ATV2

Yahoo group: eu-amsat
Date: 2010-02-17 06:31:23 UTC
From: Luc Leblanc
Topic: 4207 Message: 4207

Will they have room for some ballast in 2011?

Mission accomplished!
ATV2 cargo vessel en route for the International Space Station

On Wednesday, February 16, Arianespace´s first mission of the year successfully launched the second ATV (Automated Transfer Vehicle), designated Johannes Kepler, for the European Space Agency.

200th Ariane launch, 56th Ariane 5 launch, 42nd success in a row

This latest successful Ariane 5 launch, the 200th Ariane launch and the first mission in 2011, once again proves the launcher´s operational capabilities. Ariane 5 handles a complete range of missions, from commercial launches into geostationary orbit to dedicated launches into special orbits.

The 56th launch of an Ariane 5, and 42nd successful mission in a row, clearly demonstrates the launcher´s reliability and availability. It also set a new payload record, by boosting more than 20 metric tons into low Earth orbit.

Today´s mission confirms that Arianespace´s launch Service & Solutions continue to set the global standard and guarantee independent access to space for all customers, including national and international space agencies, private firms and governments.

Second successful Ariane 5 ES launch

For the ATV2 Johannes Kepler mission, Arianespace used the Ariane 5 ES version of the launcher. It was the second successful launch of this version, following the original ATV1 Jules Verne mission in March 2008.

Arianespace uses the Ariane 5 ES version to launch ATV cargo vessels to the International Space Station. Ariane 5 ES uses the same lower composite as the standard Ariane 5 ECA launcher, comprising the cryogenic main stage and solid boosters, plus a special upper composite, the EPS reignitable storable propellant stage.

A new mission for the Guiana Space Center

Today´s launch marks Arianespace´s second mission to the International Space Station, confirming the Guiana Space Center´s membership in the highly select "club" of launch sites serving the Space Station, alongside Baikonur, Cape Canaveral and Tanegashima.

From: allan_gm1sxx
Topic: 4211 Message: 4211

Hi,

The twice delayed launch of Yubileiny-2 amateur radio satellite is now targeted for 29th March 2011 from Plesetsk on a Rockot/Briz KM launch vehicle.

The Rockot should be carrying the following birds... Russian communications satellites (Gonets M, Rodnik), Russian amateur satellite (Yubileyniy 2).

Like Yubileiny-1, Yubileiny-2 will be a downlink-only bird and will almost certainly use the Doka-B Telemetry and control system that has become the Reshetnev bureau's new standard telemetry & control system for small satellites. LEO orbit with 82 degrees inclination.

The main payload Gonets (messenger) is a store-dump message forwarding satellite system (commercial/military)

Hello Allan

Thanks for the info. Can you tell us, what have a Doka-B Telemetry and control system to do with amateur radio ?? You named it "Russian amateur satellite". This and all coming satellites from the Reshetnev bureau is and will be intruders if they occupy the 435 MHz band. I'm worry about this situation ! Are you enthusiastic, if FUNcube, ARISSat, AMSAT-Fox aso. will be QRMed from this satellites ? Probably not.

I hope, the editor from the very good and interesting written News on Southgate ARC will not name this satellite as "Amateur satellite". There was a tendency for this in last time.

HO-68's downlink is also in the 435 MHz band. I heard AO-51 QRMed by Yubileiny-1. Both have nearly the same downlink frequency with respect of Doppler.

Please don't shoot the messenger! NO... not Gonets (Messenger / Courier) ....me! I'm only reporting the planned launch.

>You named it "Russian amateur satellite".
Actually, Reshetnev names it that, not me.

I didn't say I was enthusiastic. I think Thomas suggested that.

The fact is that I'm actually about as *un*-enthusiastic about this one as I am about *all* of the other Downlink-Only 'me too' University birds.

The Russian Federal Space agency had this to say, a couple of months ago...

"Yubileiny-2 is developed by ISS together with SIBSAU (Siberian State Aerospace University). The experimental spacecraft will be used to validate scientific and educational technologies."

'Educational' being the operative word.

From what I have discovered, the spaceframe and some expertise is being supplied by Reshetnev Bureau, but this is actually a (SIBSAU) university student bird.

C'mon guys... pleading 'education' is the best way I know of to put a 'free' downlink in the amateur radio satellite allocations. It's absolutely nothing new. It's been happening since at least 1981 (UoSAT1), and possibly earlier than that.

Nobody is against education. But the communication protocols must be open and modulations common if this satellites transmits in the HAM bands. DOKA-B has absolutely nothing to do with HAM radio, its commercial or militarily.

If we satellite HAMs are pleased about every satellite which transmits its "bull shit" (Sorry) on our frequencies, then we shovel our own groves. We have to be more critical about such satellites !

Hi group.

My understanding is that DOKA-B is based on a standard protocol and uses 2M up / 70Cms DOWN. It's also not a new protocol any more.

Telemetry and control protocols for use on amateur satellites need not be derived from amateur radio in their origins. CW is a good example of such a protocol, (from the telegraph), and let us not forget that AX25 amateur radio packet protocol was derived from the commercial X.25 network packet-switching protocol.

And no, I'm not looking forward to the launch of another downlink only bird.

For anyone still reading, the satellite does have an uplink... on 2M, and a downlink on 70Cms, but NOT intended for amateur radio use. This is something it shares in common with many, if great majority, of the other 'downlink-only' satellites. I don't class any of them as amateur radio satellites.

Your point of view may vary, of course, depending on whether you are a radio amateur or an educator, or employed by the military, or any combination of all three, and as LA2QAA has already pointed out, 70CMs is a shared band anyway. He should know. He used to work for the military, so he *has* sat on two of the three sides of the fence.

The military are the Primary Users of 70Cms in almost every country. Reshetnev could just as easily have called it a military satellite, but chose not to. The truth is that it doesn't much matter anyway. We are only kidding ourselves if we think differently.

I think the real problem we all face is that of downlink-only 'amateur radio' satellites. They contribute nothing of interest for the average radio amateur. IMO they are the real band intruders.

It's hardly fair or reasonable to call one university downlink-only satellite an 'amateur radio satellite' while labelling another one as an intruder. Don't you think?

Hello Group

If I compare the shortwave amateurs with the satellite amateurs, the shortwave HAMs gains new frequencies and we satellite HAMs (will) lose frequencies. How long as AMSAT organisations not participates in the IARU, nothing will change.

To anybody who might be in the least bit interested.

I'm sorry to say that of late, AO-7 also seems to have degenerated into an FM style free-for-all.

I remember when we were actually able to have a chat on this fine old Lady.

What is both amusing and sad is that the 'NEW' operators find it necessary to call CQ on top! of the stations
already in QSO ... while 20K/cs either side - the QRG is free. I spent almost the whole of the last pass monitoring the chaos on 145.940 +/-

This afternoon, one of the Russian regulars asked one of these 'new' stations to PSE QSY - when he heard tried to teply to my call ... and was immediately and deliberately permanently QRM'd on the key for his audacity.

(Yes, I did hear you Igor but I chose to QRT).

Admittedly, I was running my usual QRP but people can! hear it providing they use their ears as well as they use their mouth.

I think It'll be a while before Frei Island appears on AO-7 again.

73 John. <la2qaa@...g>

It's sad that the best resource we had is now nothing more than a 599 machine.

Where is the organisation that ought to be responsible for teaching operating proceedure?

A good point Thomas.

Clearly AMSAT groups cannot be member societies of the IARU since membership is restricted to one national society per country but what they can do is work with their own National Society to both explain Amateur satellites to them and also to encourage the Societies to get new satellite bands on the IARU agenda so they in turn can work with ITU representatives. Also where applicable we should be looking to see if additional spectrum may be found in existing bands.

A couple of years ago an attempt was made to get IARU Region 1 to approve of a weak signal CW and SSB only satellite downlink segment at 144.0-144.035MHz. That particular segment of 2m is little used these days. The Moonbounce activity has moved up the band to the WSJT frequencies and what little 2m CW activity is left tends to cluster around 144.050MHz.

The RSGB put forward a paper into IARU-R1 for such an allocation but unfortunately at that time it was voted down perhaps because the delegates from other countries were not familiar with Amateur Satellites.

Our 435-438MHz satellite band is shared with high power military over-the-horizon radars in addition to other military comms. 435-438 is also shared with non-amateur satellites. In about 2000, at I believe the same WRC that allocated 1260-1300MHz to Galilleo, the band 432-438MHz was allocated to satellites that carry Synthetic-Aperture Radar(SAR)systems.

As well as our 1260-1270MHz segment being allocated to the Gallileo GPS system our 2400MHz allocation is now so full of Wifi and other comsumer products that it's virtually useless in urban areas.

We do not have any Primary Amateur Satellite frequencies between 146MHz and 24GHz and in many countries even the Primary 24GHz allocation is shared with Vehicle Radar systems used for parking etc.

However, it is encouraging that in the last couple of years IARU has listed new global Amateur Satellite Service allocations at 50MHz and 3400MHz as two of its objectives. Up until 3 years ago new amateur satellite allocations simply weren't on the IARU agenda at all.

"Our 435-438MHz satellite band is shared"
Ours?
How can it be *ours* yet shared? We are secondary users after all.

In London, for example, the Mango shops are licensed in the 70Cms band. It's not 'our' band. There are plenty of other OFCOM licensed civilian users on 70Cms too, who have every right to be there. Have a look on the OFCOM website or in any of the common 'Frequency List' books you can buy.

" As well as our 1260-1270MHz segment being allocated to the Gallileo GPS system"
.....ditto.

Yet again, these are not 'our' frequencies. We only get to share them on the basis of non-interference to the Primary users.
We share 23Cms with the Primary Users (Military and CAA plus others, as best I can tell) on a secondary basis. Not 'our' band.

I believe NATS (UK National Air Traffic Control Service) operate air traffic control RADARs there. This I suspect is why it takes so long for any beacon or repeater application on 23CMs to be approved. The 'big boys' all have to OK it.

13Cms is an ISM band. We have no 'rights' there either. These bands are a free-for all. Anything goes, including leaky microwave ovens and RF welding machines.

There are allocations where radio amateurs have Primary user rights, but 70, 23 and 13Cms are included.

'Ours' and 'shared' don't belong in the same statement.

We have moved to 5.8Ghz WLAN systems at work because 2400 is too congested now. No doubt 5.8 will also in due course become saturated as demand for broadband networking keeps increasing.

In bands where we are not Primary users, we have really no justification to complain. At least that is my understanding of the situation, from reading my BR68. I think we'd best get used to it.

73 Al.

P.S. For non UK readers.. BR68 is the UK 'terms, provisions and limitations' document for amateur radio users.

If you are saying it's not "ours" then you can't have a problem with satellites such as Yubileiny-2 using it can you?

It's our satellite allocation because the ITU assigned it to us. Unfortunately it's only a secondary allocation with other services also using the frequencies. Such is the nature of shared bands.

Many years ago there was no great problem in having shared allocations at UHF and Microwaves since they weren't heavily used by other services but as years have gone by the level of use by other services has steadily increased.

What we ideally need is a number of narrow (say 3 or 4 megs) Primary allocations across the 400MHz to 10.5GHz spectrum but I fear it'll take us many years if decades before we get that.

If you have read the IARU R1 bandplans, you'll *know* the band is 'not 'ours'. The point I was making is that we get to share the band as Secondary users with all that being Secondary entails.

In any event, Yubileiny-2 could just as easily have been called a 'military' satellite, by its builders, in which case it could also legitimately use 70Cms. There's always an easy way to have a downlink on 70Cms.

> What we ideally need is a number of narrow (say 3 or 4 megs) Primary allocations across the 400MHz to 10.5GHz spectrum but I fear it'll take us many years if decades before we get that.

Do you think so? Have you considered Doppler shift? By going to those frequencies, you effectively alienate a very large percentage of your potential user base, the ones who might be tempted to join, or even re-join, AMSAT, because they don't have the cash, or the will, to buy transverters, CAT controlled transceivers,auto-doppler and what have you that you *need* for these frequencies.

This is especially true for satellites in LEO. IMHO Higher frequencies = fewer paying members.

A primary satellite allocation on 50Mhz would surely be so much more useful. Not much fun for the satellite builders, being too low tech, but far more practical for the end users.

29.3-29.510Mhz? Don't be silly man! ... that would be far too easy, and we *can't* have that. We even have a Primary allocation there already and as best I can tell, we choose not to use it. Folks might actually want to *use* such a satellite, and could even already have gear for that band in their shacks ;-)

And yes Thomas... I do know your personal thoughts on 29Mhz, should you read this.

Have a good day.

I don't know what you mean Al. I'm QRV on AO-7 Mode-A and if the 10m
band is open (Es) and no satellite overflies my QTH, I'm QRV on 28 MHz.

Back to satellites: Please read my previous mail, an answer would be
glad. You can also start a new thread.

4227. AMSAT INDIA News Letter- March 2011

Yahoo group: eu-amsat
Date: 2011-03-15 17:02:53 UTC
From: Nitin Muttin
Topic: 4227 Message: 4227

AMSAT INDIA's March 2011 News letter is available for download. The PDF of the newsletter is available at http://amsatindia.org/Newsletter/AMSATINDIA-News-March_2011.pdf and the archives at www.amsatindia.org/Newsletter

Content of the Newsletter

1. Update on the Technical talk held on February 20th 2011

2. Update on the Cubesat Transponder project by AMSAT INDIA.

3. Report by Anantha- VU3GPF on the scheduled contact with ISS with his school in India.

4. VU4PB - DXpedition by Amateur Radio Society of India (ARSI) to Andaman and Nicobar.

5. News from AMSAT Organizations worldwide.

73's

Nitin [VU3TYG]

Secretary, AMSAT INDIA

4231. A new threat to 70Cms.

Yahoo group: eu-amsat
Date: 2011-03-21 10:16:27 UTC
From: allan_gm1sxx
Topic: 4231 Message: 4231

In the US, it seems a new threat is emerging for the 7Cms band, centred around a proposed public safety broadband network based on 70Cms. For anyone who had not read about it already, you can read more on the ARRL website at..

http://www.arrl.org/news/view/spectrum-management-bill-threatens-amateur-frequencies

It would appear that a new spectrum management bill proposed in the US is the latest threat to 70Cms amateur radio and 70Cms amateur satellite segment.

The original document is at..
http://www.gpo.gov/fdsys/pkg/BILLS-112hr607ih/pdf/BILLS-112hr607ih.pdf

The bill suggests the use of 420-440 and 450-470Mhz for this service.
This of course encompasesses the entire 70Cms allocation. Not good news for amateur radio users of 70Cms.

Al.

Hello Al

How does this bill threaten the IARU regions 1 & 3 ? We lost the sub band 435 - 438 MHz anyway to commercial, "educational" & military satellites.

4233. Clyde Space to build UKube-1 Microsat

Yahoo group: eu-amsat
Date: 2011-03-22 15:49:22 UTC
From: allan_gm1sxx
Topic: 4233 Message: 4233

Local Glasgow company Clyde Space are to build the UK's first Cubesat.
More at..

http://www.clyde-space.com/news/311_uk-s-first-cubesat-mission-starts-to-take-shape

UKube-1 should carry the Funcube transponder as part of it's payload.
Launch is expected sometime next year, but no firm launch info is forthcoming.

Clyde Space have a proven track record in space hardware. They are vendors for Microsat kits and specialise in satellite power systems.. batteries, BCR's and solar panels. More company info at
www.clyde-space.com

More info on the payload and frequencies at..
http://www.amsatuk.me.uk/iaru/finished_detail.php?serialnum=203

If 435-438 were lost in the States then that's the end of it world-wide.

Regions 2 and 3 (and Denmark!) have an Amateur Satellite Service allocation at 3400-3410MHz but the band is of no use until it's available in all 3 regions.

We haven't lost 435-438 in Europe, it always was part of the military 420-450MHz band as it is in the United States.

You mention that 435-438 has been "lost" to Commercial Interests. Which commercial interests are you refering to ?

UKub-1 ... new & innovative my arse!.

when I was a snotty-nosed kid, the UK did have the chance to be innovative in space - but in their
infinate wisdom they scrapped the program.

Interestingly, one of the old coloniesnow has it's own successful space program, it's own GPS system
and it's own heavy launch vehicles ... maybe the boys at Leicester could ask India for some advice ???.

I had overdone a little bit. ;-) But the first commercial CubeSat was QuakeSat from QuakeFinder Corp. in California, launched at 30.06.2003. I think there are also a few other CubeSats with a commercial service we don't know about. We also don't know about the services from this Russian satellites with DOKA transponder on 435 MHz. Their services are no gifts, they are commercially I think.

If you have other informations, I'm open to learn.

Hello Mike,
Thank you for your kind words. Actually, I've gone back to 100% QRP'ing - (G-QRP 74).

I started in Ham radio with a homebrewed HW-8 and have ZL confirmed with 2 watts (CW). I've just purchased the Ten-Tec 1320, I note that you have one too. I also had the original Argonaut when i lived
on Gossen Island and managed a SSB DXCC with that rig. A CW DXCC was worked with the HW-8. An RTTY one came later an a Swan 500C !!! ... clank ... clank ... clank ... (relays).

I'll stay maintaining the reflector, just in case HO-68 comes back on line. Alan said he'd look at it when
he gets back from the DX-pedition.

Hey! ... you never know, the operating might have improved by then ... and pigs! might fly ... he he he.

Oh well, if pigs did fly, the price of bacon would go up.

Keep in touch Mike.

73 John.

Hi John

Just dismantle don't discard it. Even here the "new trend" seems to reach us:

From AMSAT-BB "The free of speech AMSAT-NA BB..."

The AO-51 repeater uplink was switched to 145.88 on the 2215 pass
tonight. I realize there are multiple grid dxpeditions out and about,
but that does not excuse some of the operating I heard tonight. If
another station is in the middle of a QSO, stand by and let them finish.
If you start to transmit and can't hear yourself, or you hear someone
else in the downlink, stop transmitting and let them make the call.
Finally, if you've worked that grid, or that station, or that country,
how about taking a breather and letting someone else work it for a new one.

73, Drew KO4MA
AMSAT VP Operations, and AO-51 Command Station

With a thigh workload schedule over here i have much less time to devote to satellite work but it will be a lesser job load to maintain the
satellite station than dismantling it here.

In the mean time i found myself some alternate activities HF digital voice and next Field Day station set up testing with vertical antennas

and Clansman PRC 320 british army transceiver (Falklands and 1st Gulf war era) experimenting XCVR brand that you probably already know.

Some project also for the next summer season and i just hope things will settled down to be able to enjoy satellite work again.

In the mean time keep the discussion group open it is a very viable alternative solution to the other one...

From: rw3xl
Topic: 4241 Message: 4241

Hello, Group!
I have a question. Have IC-910 triband, how to change main or sub band via CAT command? For example: MAIN is 145500 and SUB 435500, I need change MAIN to 1260200. No idea for now. Manually I must push M/S button and hold it for about 1-2 seconds and band changed. I can "push" M/S via CAT, but can't "to hold" it via CAT. I have original instruction manual but can't find "band change" in the command list.

4250. [amsat-bb] ARISSat-1 Activation 04/12

Yahoo group: eu-amsat
Date: 2011-04-07 22:08:16 UTC
From: st2nh
Topic: 4250 Message: 4250

Subject: [amsat-bb] ARISSat-1 Activation 04/12
From: Clint Bradford
Date: Thu, 07 Apr 2011 13:19:40 -0700

From AMSAT-NA -

The transmissions will begin on Monday 11 April 2011 at 14:30 UTC and continue until 10:30 UTC on 13 April 2011.

Due to the fact that the solar panels are covered, the satellite will be powered only by the onboard battery. The satellite will run in low power mode. This means that the transmissions will cycle ON/OFF. They will be ON for 40-60 seconds and OFF for 2 minutes.

145.950 MHz FM Downlink:
FM transmissions will cycle between a voice ID, select telemetry values, 24 international greeting messages in 15 languages and SSTV images. One of the messages will be a conversation between Yuri Gagarin and ground control.

145.919 MHz CW Beacon
The CW transmissions will be callsign ID, select telemetry, and callsigns of people actively involved with the ARISS program.

145.920 MHz SSB BPSK-1000 Telemetry
The BPSK transmissions will feature a new 1kBPSK protocol developed by Phil Karn, KA9Q to be readable in low signal level conditions. The BPSK data will transmit satellite telemetry. Free ground station soundcard demodulator and display software will be available.

Note that the linear transponder will not be active during this event

Hi Petr

You probably say what we all know and do not want to tell...AMSAT-NA AND ARISS is censoring what they feel is not in line with what they
think is right to protect their image.

As usual it is a complete mess as nobody seems to control anything aside of babbling a lot of non sense.

I doubt you will see this message on AMSAT-NA that's why i crossed posted it on EU-amsat reflector where we are FREE to express our
opinions.

So much to say here and so few time to spent for nothing but i respect the courage of those of have guts to express and voice their
opinion.

AMSAT-NA is a poor and cheap organization who does not respect the freedom of speech of their constituent. There is no need to fund a so
poor managed group even if they are pretending a lot mostly fabulation and uncoordinated actions.

Just look at the ARISAT saga 5 different names for one satellite made in US but nor even launch or put in operation as schedule by he
Russian. I was on the air last night with a lot of poor soul sleep deprive awaiting the revelation but they probably feel asleep hoping for
the resurrection even if easter is in 2 weeks...

To: amsat-bb@...
Copies to: sarex@..., eu-amsat@yahoogroups.com
Send reply to: no_reply@yahoogroups.com
Priority: normal

It seems the above mentioned post never pass the AMSAT-NA censorship

Is this message violate: The Unacceptable Content criteria?

Unacceptable Content
Strong disagreements on issues are inevitable, but the AMSAT mailing lists are not the place for exchanges which become spiteful,
unproductive exchanges. If you must have a heated exchange, it should be conducted privately and not in public on a mailing list.
We define unacceptable content as anything that is:
o Illegal
o Insulting, abusive, harassing, or threatening
o Knowingly false or misrepresentative

Is it violating the:"Acceptable Content" criteria

Acceptable Content
We embrace diversity of opinions and values. In order to preserve a constructive environment, we do insist that messages contain
appropriate content and are respectful of the members and readers of the list.
All posts should include the author's first name and call sign, or full name if not currently licensed.
In general, messages for the AMSAT mailing lists should be related to amateur radio satellites. Examples of on-topic posts include:
o Announcements of general interest, including but not limited to AMSAT news, meetings, satellite availability, and DXpeditions.
o Technical discussions, including the physics of space flight, modulation techniques, satellite design, RF path loss calculations, noise
figure, etc.

I silently watch the AMSAT-BB since about 8 months now and i think it is time to escalate things a bit further up... It could be have an
impact soon somewhere just hope the hiding silent AMSAT-NA president will act as it seems to sleep on the switch...What another convenient

president for AMSAT-NA stiking to the glue paper instead to show up on the internet!!!.

> On the trip out, no questions. On the way back, the luggage inspector asked what it was as it showed up on the scan. He accepted my explanation when I told him I was a ham. Maybe he was simply curious, but I had my amateur radio certificate with me just in case I had to give more details.
>
> 73s
>
> Bernhard VA6BMJ @ DO33FL

In your checked bagage dismantle you arrow and put your elements in a 1"1/2 plastic (PVC) plumbing pipe cut to fit the longest element.
Seal both end with clear plactic bag in a way for the inspector to see through it. You can put fishing rod section wrap around the pipe it
will propbably not trigger enough questions in the inspector mind and he can let go your suitcase. I found the TSB search card in one of my
suitcase with the pipe one time and no question ask

For carry on follow an excellent suggestion made. Just pur your radio wires antenna in clear zip lock bag and put them in a separate
plastic search box. They want to see understand. One female inspector told me once when i asked her why my carry on suitcase has been
manually inspected, she told me it was not the stuff but the huge number of items who made them searching manually!!!

Put more bag with less stock in them it helps.

Hello Al

You can also read the report from sight of AMSAT:
http://www.amsat.org/amsat-new/images/fck_images/April_14_ARISSat_Status%282%29.pdf

There are also many speculations flowing around. My personal opinion
is AMSAT and NASA should cancel the partnership with RSC Energia. NASA
would be the better partner to AMSAT for new educational satellite
projects.

Hi Group.

Well, look on the bright side. At least ARISSAT has made it into LEO. That has to be a positive thing, surely? Soon RKK/RSC Energia will be the only game in town, to get people into space, not forgetting the fact that they also launch cargo to the ISS. Surely nny opportunity for satellite launches has to be better than none?

ARISSAT is quite a large bird by today's shrinking standards, so to get a launch at all, was no mean feat. The Progress cargo vehicle is not a large craft. We should be very grateful for the launch opportunity.

Hmmm... I don't agree. If you have a partner in this business who disregards agreements, its better you look for a new one, also for just a HAM satellite. The OM's had invested time and sweat to build ARISSat. Otherways we have a satellite with an empty battery in orbit. That is not a positive thing. AMSAT-NA has a partner in NASA and ESA is also a player in transportation to the ISS with their ATV's on an Ariane-5 (http://en.wikipedia.org/wiki/Edoardo_Amaldi_ATV).

OK, RSC Energia sends more vehicles to the ISS than ESA, but AMSAT-NA is not building a satellite every month. If you concentrate you to only one launch agency you will miss another one.

The financial aspects are not respected in my thoughts.

In financial term rcs-energia must have contributed the equivalent of 150,000 Euros for the launch costs of ARISSat-1 and will hopefully also fund the launch of the others. In addition they are also providing the time of their personel both on the ground and in the ISS.

We can but hope there will be a satisfactory outcome in July.

I agree with Gordon but his "emcomm morons who like to play at being
police dispatchers" are more related to an amateur radio operator than the type of
modulation or system he used.

It can be a SSB HF moron, a CW HF moron, a VHF/UHF FM repeater moron and so on.

What's reflect the intelligence level is not related to DSTAR protocol as we can all see :)

4270. Second Call for Speakers for AMSAT UK Colloquium 2011

Yahoo group: eu-amsat
Date: 2011-05-10 16:45:15 UTC
From: David Johnson
Topic: 4270 Message: 4270

Hi All,

This is the second call for speakers for the AMSAT-UK Colloquium 2011
which will be held at the Holiday Inn, Guildford, UK
(same venue as in 2010) from *Sat 30 Jul to Sun 31 July 2011*

AMSAT-UK invite speakers, about amateur radio, space and associated
activities, for this event.

Offers of talks should be sent *ONLY* to G4DPZ, via the following routes:

e-mail: david.johnson AT blackpepper.co.uk

SnailMail: QTHR fromwww.QRZ.com

Likewise if anyone knows of a good speaker, please send contact and other
information to G4DPZ.

> after hearing this, I'm even more convinced.
>

I was for years in the past warning satellites amateur radio operators to push for a HEO amateur satellite as many other satellite users.
There was 2 main reason for this:

The first one was to replace AO40. The second one was to offer a sustainable space amateur communication platform. As off today only AMSAT-DL is working toward this option. AO-51 is at the end of his life with no replacement solution actually in space. On the table only the same old solution another LEO. The debate over HEO vs LEO was largely debated on this BB and on other discussion forum, but remain on indisputable reality Amateur satellite frequencies are more and more used by non amateur group for only short term experiment with satellite unable to sustain long period of operation or only used to collect data from various experiment.

On earth in the mean time there is a lot of activity growing around various digital communication system lets say it is what's is cool now in the amateur radio world. We can be for or against it but only speaking about DSTAR a revolution is slowly growing attracting more and more peoples with the need of more frequencies as recently seen in Italy and it seems that the fact a frequency was used for satellite work does not matter much folks who decided to setup their machine right on the ISS downlink frequency!!!

I make the second recorded test on an amateur radio satellite using DSTAR on AO-27 see my web page www.qsl.net/ve2dwe

I'm actually involved in the DSTAR development here in Quebec and the pace of growth of this new mode is constant and the new features of DSTAR are coming each and every day. DGPRS, High speed data transfer and so on.
There is a huge potential on DSTAR to interface earth and space communication even making mobile operation possible.

What's is limiting DSTAR development is our imagination and skills. I repeat what i wrote in the past if the amateur satellite community
does not innovate and want's to remain always in the same track, we will assist sooner or later at the end of this part of our hobby.

I was very critical about ways the AMSAT'S group where conducting their business i still was and time is only confirming what i was
writing. AMSAT France has been dissolved and many other are not operating any more. Who need an AMSAT group where no satellite are
available to communicate?

I just noted about 30 amateur radio equipment setup for sale in the past 12 months. When a group is controlling the information from his
constituents it is the first sign of their weakness and vulnerability refusing to listen and refusing to evoluate will only lead to their
demise and it's already happening.

Instead to be against everything aside of the party line it will be wise to go further than official mind set..

Dear All

I have been playing with tape measure steel tape and using it to make useable, cheap hand held beam antennas for working the FM satellites.

I have up-loaded 10 files to the folder:
"Tape Measure Tape Antennas".

Please read "ReadMeFirst" before opening the folders.

Please NOTE the CAUTION about using "Tape Measure Tape" before trying to make any of the antennas.

Otherwise ENJOY!

Graham G7TEG

Hi Graham.

Tape measure yagis certainly work well. I use them myself. I also find them good for /P ops in the local hills. They are cheap and have plenty of uses. Safety first of course, when handling the sharp springy tape measure material.
Thanks for the input.

Oscar-11 was believed lost for many months after it's launch but it was eventually recovered and went on to give many years of useful life.

Lets hope they can find a resolution. Perhaps they can find a way to get it stuck in Linear Transponder mode instead 8-)

Whatever the outcome the important thing is that the CAMSAT team will have identified a weak spot in the design and will be able to address that issue on the next CAMSAT payload to be launched.

Our local Ham club is actually involved in the DSTAR revolution and we change one of our analog repeater to a DSTAR repeater without the
need to get a new pair of frequencies. It is not always possible to do so due to local reality. In some location some repeater are not
using CTCSS tone and they a subject to interference from a digital repeater even those protected can suffer the same issues.

This issue should be resolve with the national amateur association in a way to inform first and coordonate as far possible theses new
repeater.

From: m5aka
Topic: 4283 Message: 4283

The 26th AMSAT-UK International Space Colloquium will be held on the weekend of July 30-31 at the Holiday Inn Hotel, Guildford, close to the University of Surrey. A special beginner's session is planned for Friday afternoon July 29.

Among the presentations will be talks on the FUNcube satellite and the FUNcube Dongle Software Defined Radio.

In additional to the lecture stream there will be the GB4FUN Mobile Communications Centre, AMSAT-UK shop, a Saturday night Gala dinner, auction and raffle.

The event is open to all Radio Amateurs and SWL's. Either day passes or full packages comprising overnight accommodation and meals are available.

Further details are available on the AMSAT-UK website at

http://www.uk.amsat.org/

Hi Marco.

Try the official website...
http://www.arissat1.org/v3/

That is as much news as I know.

Marco, I see "Deactivation" in your title now. The Russian ARISS-Team
said the Satellite is stored in the ISS and the battery is disconnected
and stored in an other place inside ISS. The battery is also in a good
health, its all OK. The release into orbit is planned for 26. July 2011.

4290. PstRotator can now accept Az/El data from Gpredict

Yahoo group: eu-amsat
Date: 2011-06-11 12:33:18 UTC
From: Codrut
Topic: 4290 Message: 4290

The PstRotator program can now accept Az/El data from Gpredict.
PstRotator is a program for antenna rotators control, and can be downloaded from
http://www.qsl.net/yo3dmu/index_Page346.htm

Gpredict Windows version can be downloaded from
http://sourceforge.net/projects/gpredict/files/Gpredict/

The communication between programs is TCP/IP, so the programs can run on the same PC, or on different PCs in a network.

PstRotator settings: select Gpredict as Tracker, and set the Tracking mode. The default IP port is 4533, but can be changed from "Setup/Trackers Setup/Gpredict Setup...".

Gpredict settings: "Edit/Preferences/Interfaces/Rotators". Add a rotator and set "localhost" to Host if tha programs run on the same computer, or the computer IP where the PstRotator is running if this is not on the same PC.

Go to "Module options / Shortcuts" (you can find it to the up & right corner of the main Gpredict window) and open the "Antenna Control" window. Press the "Engage" button to connect Gpredict to PstRotator.
For satellites tracking select a satellite in view and press the "Track" button.

Hi Marco,

I'm not expecting to hear anything until a few days before the space walk.

Keep an eye on the itinerary for the space walk which should be available at some point on the NASA and probably also Roscosmos websites.

For the February space walk the deployment of Kedr (ARISSat-1) appeared in the itinerary up until the day before the walk when it was removed.

4293. New AMSAT-UK Website

Yahoo group: eu-amsat
Date: 2011-06-16 10:32:49 UTC
From: m5aka
Topic: 4293 Message: 4293

AMSAT-UK has a new website developed by Dominic Hawken G6NQO, the new webmaster is Rob Styles M0TFO.

The site features links to the new AMSAT-UK Online shop run by Ciaran Morgan, M0XTD. The online shop carries a range of hardware items/projects and software suitable for Amateur Radio Satellite activities as well as the ability to join/renew your membership to AMSAT-UK.

Visit the new site at
http://www.uk.amsat.org/

The AMSAT-UK International Colloquium takes place July 30-31. The event is open to all and further information can be found at
http://www.uk.amsat.org/colloquium-2011

AMSAT-UK publishes a color A4 newsletter, OSCAR News, which is full of Amateur Satellite information.
Join online at http://tinyurl.com/JoinAMSAT-UK

As usual i crossed posted this one to the AMSAT-EU reflector as it will SURELY not pass on AMSAT-BB. as it is not in favour of AMSAT-NA...

So many deception on so numerous volunteers who wants to help but turned down as their skills was not enough... Just read the following
one...

>After 25 years continuous employment by the Institute for Defense Analyses,
>I am moving on. I have an exciting new position at Va. Tech. and will be
>back in four land starting next week.

> http://www.vtnews.vt.edu/articles/2011/06/061511-engineering-mcgwierhumedirector.html

But for an AMSAT-NA Filthy Few all goes even autoself recognition lets call self auto satisfaction :)

I don't know what will be the discussion topics when AO-51 stops working on AMSAT-BB? GRID chasing on linear birds? a disguised CB 21st
century trend? It will at least force people to evolved from cloths hanger station to AMSAT CLASS station! And don't get me wrong i have
nothing against cloths hanger;)

Topic: 4301 Message: 4301

Hello All

See the interesting entry at IARU about Edusat:
http://www.amsatuk.me.uk/iaru/informal_detail.php?serialnum=202

The last 2 mutations are

"**It was planned to deploy the MyPocketQubs, the two Eagle payloads
and the ScoutQub sometime after launch, but it is understood that this
test will now be undertaken by a later UniSat-5 spacecraft**"

and

"**Understood to be 9k6 GMSK using a proprietary system.**"

Does the Italian ministry of communications not understand what
Amateur Radio is ??

What is the problem with being proprietary, Thomas? It's not illegal.

Does that mean that Thomas also disapproves of the very popular and widespread D-Star?

I don't believe there is anything in the amateur radio 'rulebook' that outlaws the use of proprietary protocols, only 'secret codes'. Being proprietary does not constitute a secret code, although of course a CW Ident would be nice.

AMBE, used in D-STAR is proprietary, and I don't hear many complaints about that, except for the usual complaint that ' it is not in the spirit of amateur radio'. This is something I heartily agree with, so I for one choose not to use D-Star. It's a free world. After all, we can choose to boycott such a protocol if we personally don't approve. You don't have to buy into it. I choose not to use D-Star because it is not in the spirit of amateur radio. These things tend to succeed or die depending on their appeal to the end user, and whether the end user believes the cost justifies the benefits. D-Star got lucky.

Yes, it's not illegal but it has nothing to do with Amateur Radio.
That's the problem. If we accept it with the phrase "it's not illegal"
the problem becomes greater till the lost of our frequencies.

> Does that mean that Thomas also disapproves of the very popular and widespread D-Star?
>

No Al. I don't know D-Star, but I would experiment with it when OUFTI-1
works in orbit. There are also Open source projects available.

For anyone still awake.
(TF) Thomas Frey
(AC) Allan Copland)

(TF) "**Understood to be 9k6 GMSK using a proprietary system.**"
Does the Italian ministry of communications not understand what
Amateur Radio is ??

(AC) What is the problem with being proprietary, Thomas? It's not illegal.

(TF) Yes, it's not illegal but it has nothing to do with Amateur Radio. That's the problem.
If we accept it with the phrase "it's not llegal" the problem becomes greater till the lost
of our frequencies.

(AC) Does that mean that Thomas also disapproves of the very popular and widespread D-Star?

(TF)"Yes, it's not illegal but it has nothing to do with Amateur Radio.
That's the problem."

(AC) What? D-Star (using GMSK) and a proprietary GMSK protocol for satellite are not
amateur radio? If they use amateur radio as the communication medium, how can they *not* be
amateur radio?

The complaint now has now 'drifted' from being against the use of a 'proprietary GMSK
system' to a claim that it's 'not amateur radio'?

If it's acceptable and legal to use on the airwaves under the terms of our licenses, how
can it not be amateur radio?

Is anyone else (who is still awake) as confused as I am?

This is wrong replayed! I wrote that I don't know D-Star but I would
experiment with it when OUFTI-1 works in space.

If Edusat transmits data with a proprietary protocol in GMSK - THIS has
nothing to do with Amateur Radio.

Hope this helps now to de-confusing.

Sorry Thomas, but it does not help *me* to understand in any way.

my explanation.
D-STAR.... proprietary GMSK
EDUSAT.... proprietary GMSK

You said...
> I wrote that I don't know D-Star but I would
experiment with it when OUFTI-1 works in space.

Both are amateur radio modes. Both are proprietary.
What is the difference? I think you are making a mountain out of a mole-hill. I don't understand your objection to one but not to the other.
This is my last word on the subject. Perhaps others would like to make their views known?

I don't use D-STAR because it was not in the spirit of amateur radio... i.e. someone is making money out of the AMBE CODEC.
That's *my* view and other are free to disagree. I chose not to use D-Star.
There is no valid reason why a proprietary protocol cannot be used on an amateur satellite.
I can choose not to use that also, if I feel strongly about it.

4308. Free sample edition of OSCAR News

Yahoo group: eu-amsat
Date: 2011-07-13 22:49:49 UTC
From: Trevor .
Topic: 4308 Message: 4308

AMSAT-UK have made available a free PDF of the Spring 2011 edition of their newletter OSCAR News.

It contains reports on four UK CubeSat projects currently being developed. News of new South African CubeSats and details of the telemetry on ARISsat-1 currently scheduled to be deployed from the International Space Station in August.

A printed copy of OSCAR News is posted to members each quarter.

Membership of AMSAT-UK is open to anyone who has an interest in Amateur Radio satellites/space activities, including the ISS. You do not have to have an amateur radio licence to join, many of our members are interested in listening to satellites and decoding the telemetry.

Read the OSCAR News PDF at

> Mit freundlichen Grüssen, Regards, 73
> Thomas Frey, HB9SKA

You are incorrect in your brash claim. Proprietary does *not* mean 'unknown data' as you so robustly claim.

It simply means that someone out there owns the codec, just as someone owns the D-STAR AMBE Codec. I suggest you look up the meaning of proprietary. It does NOT mean closed.

This has all the same shades of trolling rant as your past claims about 'our frequencies'... that are mostly NOT ours...we share many of them as secondary users..... and your claim that the DOKA-B telemetry system was illegal.. which it is not... it's only simple manchester coded data. Perfectly acceptable.

So long as the means exists to decode a signal, it is not secret code, and is therefore acceptable to the authorities, otherwise D-STAR would also be banned!

Under 'Thomas rules', 400bits/second telemetry must also count as 'illegal. It also is "+"*ç%&/()=?`'" unless you have the means to decode it. Time to join the real world Thomas.

Next you'll want to 'outlaw' data from educational CUBSATs
I'd be a bit more careful in future about what you complain about.

Finally, as a member of the group *you* have no right to order that the thread is closed. Only the group administrator has that right.

Just before the thread "close" I am an actual DSTAR user here even making one test on AO-27 you can hear it on my web page
www.qsl.net/ve2dwe DSTAR is a growing new communication mode and it is a tool who help us to retain and gain new members in our local ham
club. We should always have in mind this actual reality "the internet" it is not an all RF mode and as all the programming code in the
actual HF and VHF/UHF rig IC's we don't have acces to it. Each manufacturing company are keeping this for themselves as the codec's for
Icom.

In the DSTAR evolution numerous other codec's are developed by some amateur groups making this field open. I respect those who does not
want to use DSTAR based on the "proprietary issue" pushing this argumenting to the limit will make us refrain to used all the actual
amateur radio transceiver as they are full of proprietary code in their IC's.

BTW i can be reach anywhere on the world with just my callsign enter in your URCALL field could be one day we will be able to have a QSO
mobile to mobile through a DSTAR satelllite?

4311. ARISSat-1 & AMSAT-UK Colloquium July 30-31

Yahoo group: eu-amsat
Date: 2011-07-18 16:02:19 UTC
From: m5aka
Topic: 4311 Message: 4311

The AMSAT-UK International Space Colloquium at the Holiday Inn, Guildford, GU2 7XZ, England will be taking place during the activation of ARISSat-1.

Members of AMSAT-UK hope to be active during the ARISSat-1 tests from the GB4FUN communications module situated in the Holiday Inn car park.

GB4FUN: http://www.gb4fun.org.uk/

It is intend to use the GB4FUN station equipment to listen to the various ARISSat-1 signals and, hopefully make a few contacts through the linear transponder.

In addition they will be experimenting with the use of FUNcube Dongle software defined radios to receive the ARISSat-1 signals with a variety of different antennas.

The Colloquium is open to all Radio Amateurs and SWL's. Either day passes or full packages comprising overnight accommodation and meals are available. For futher information see http://www.uk.amsat.org/colloquium-2011/

AMSAT-UK: http://www.uk.amsat.org/

Thanks Marco and Thomas for your comments. I will try this when time permits.

Fastrak is, I believe, a TLE updater from NASA. It used to work fine but has recently refused to update the Orbitron TLEs.

Thanks again,

You may know it as Arissat-1 or RadioSkaf-2
From RIA Novosti..

"ISS crew to launch mini-satellite on August 3

Russian cosmonauts aboard the International Space Station (ISS) will launch a mini-satellite during a spacewalk on August 3, mission control said on Friday. The mini-satellite, Kedr, is part of the Amateur Radio on the International Space Station (ARISS) project, and is designed to transmit greeting messages in 15 languages and relay images of Earth and telemetry data to amateur radio operators as it orbits the Earth.

Its name comes from Russian cosmonaut Yury Gagarin's call sign and it is being launched in honor of the 50th anniversary of Garagin's flight. Cosmonauts Alexander Samokutyaev and Sergei Volkov will launch Kedr manually during a six-hour spacewalk. The Kedr was delivered to the ISS by a Russian cargo spacecraft, Progress M-09M, on January 30."

Cc: AMSAT-INDIA; VUHAMS
Subject: [amsatindia] ARISSat 1 over India

Test transmission Signals from ARISSat 1 was heard over India during
05:30 pass (70 deg Ele over Bangalore).
The following are the stations from Bangalore monitored the signals:
VU2WMY Mani
VU2RMS Ramesh
VU2GUR Guru
VU3SXE Sandeep

During the ten minute pass, the voice telemetry message, YL voice
identification message, pass word, Male voice message in Russian and
the SSTV signals were heard.

The consolidated report is that: the signals on 437.550 was very
strong with scale readings 5/6. Was able to record the entire pass.

Good wishes and Greetings from India to ARISSat Team and we all look
forward eagerly for the ARISSat launch from ISS on August 3rd.

>
On a frame by frame replay it was even very evident that the satellite has been thrown away just by watching the swing of the central long
whip. As the first spacesuit sat issues we will have to have VERY HIGH ERP to be able to be heard on ARISSat-1 in the event of the
unconfirmed "yet" UHF antenna status. It was very apparent they want to regain their late time in hurry and they seems to have broken
something (Very hard to see even in a frame by frame view as the images are most of the time fuzzy in that mode) in their EVA tool and
equipment reteriving from the air lock. Something hit the antenna but the images after this collision are too fuzzy to be able to verify if
any dammages where present. They where not even sure how many antenna where installed on it!!!!!

MY EDUCATED GUESS

They broke the UHF antenna in their hurry to get rid of this BOX and they let it go as it was not an essential task!

It will now be interresting to know wich mode are activated to be able to focus our listening task on the right place.

If an antenna is damaged i think it could be the UHF. I was able to hear myself in the short linear transponder window but at this level no

sustain QSO is possible.

The DATA/CW and the FM signal where booming here near S9. I can hear the transponder noise but are just over the noise level

I will check and try some recording of the FM messages.

Yes, I can confirm this. The hatch was officially opened at 14:50 UTC
and ARISSat-1 was deployed at 15:07 UTC. I watched NASA-TV yesterday
after 14:00 UTC or 16.00 MESZ. Someone mixed his local time with UTC
or GMT I think.

4330. RadioSkaf /Kedr/Cedar/Arissat-1/Oscar ??? on the BBC.

Yahoo group: eu-amsat
Date: 2011-08-04 13:19:39 UTC
From: allan_gm1sxx
Topic: 4330 Message: 4330

Hi.

BBC carrying a video clip in which the crew discuss RadioSkaf and what to do since it's antenna configuration' has a problem. Unfortunately the video ends just as things are getting interesting!

http://www.bbc.co.uk/news/science-environment-14388224

I'm now wondering if there is a better post of the spacewalk elsewhere.

Regards,
Al.

4331. More on that pesky 70Cms antenna

Yahoo group: eu-amsat
Date: 2011-08-04 13:33:05 UTC
From: allan_gm1sxx
Topic: 4331 Message: 4331

Hi,

It would seem likely that the Radioskaf satellite has been deployed with only the 2M antenna in place.

>As they began their spacewalk with plans to toss the satellite from the station, Russian flight control teams noticed the absence of a second antenna in live video views. After a round of troubleshooting, Moscow directed the spacewalkers to continue with the deployment, though the second antenna was either tucked inside the satellite or missing altogether.

More detailed info at...
http://spacecoalition.com/blog/education/spacewalking-cosmonauts-launch-educational-satellite?utm_source=feedburner&utm_medium=feed&utm_campaign=Feed%3A+CoalitionForSpaceExploration+%28Coalition+for+Space+Exploration%29&utm_content=Google+UK&doing_wp_cron

Another post at ...
http://www.nasaspaceflight.com/2011/08/cosmonauts-russian-spacewalk-international-space-station/

says...

>During the EVA, the satellite was manually jettisoned in a retrograde (aft) direction from the ISS, so that it will not pose a debris threat in the future. The satellite will eventually run out of power and burn up in Earth's atmosphere.

>This was supposed to be the first task of the spacewalk. However, after noticing only one ☐ instead of two ☐ antennas on the device, controllers asked to defer the task until later in the EVA to check the configuration.

>After confirming one antenna was missing, controllers decided to press ahead and deploy the satellite, which was confirmed at 1:43pm Central time. There will be a 50 percent loss in performance due to the missing antenna.

Much of the other stuff I've seen posted seems to be derived from the above posts. Makes me wonder why they didn't abandon the deployment and return the satellite to the ISS via the airlock for the problem to be debugged properly. After all, there will be other spacewalks.

73 Al.

But the next Russian space walk isn't until Feb 2012 and there's always the risk that there wouldn't be spare time in the scedule of that EVA. They did take a massive chunk of time out of yesterdays EVA to deploy ARISSat.

Still despite the antenna being snapped off it was encouraging to see that Drew and others have managed to get a signal through the transponder. This hopefully means that with enough power it can be commanded as well.

So even without an uplink antenna it should still be able to achieve almost all the mission objectives.

As the NASA announcer said there are another three ARISSat's waiting to be launched (one is already in Russia) so there's plenty to look forward to over the next couple of years.

4336. ARRISSat-1 Report and Thanks

Yahoo group: eu-amsat
Date: 2011-08-05 13:40:01 UTC
From: Nitin Muttin
Topic: 4336 Message: 4336

It was a great pleasure to watch the deployment of the ARRISSat-1 from the ISS on NASA TV. On behalf of AMSAT INDIA I would like to thank all at AMSAT , ARRISSat project team for enabling this capability for the Amateur Radio fraternity. I was able to hear the signals on 145.950 during the 03:57 UTC on 08/5/2011 over India and decoded a SSTV image and heard the CW on 145.919 but was unable to decode the telemetry using ARISSATLM application. Will try again to decode the telemetry and also the linear transponder. Many Radio Hams in Bangalore have reported hearing the signals on 145.950.

The image can be found at http://vu3tyg.addr.com/ARRISSAT/Arissat.jpg

The recording of the voice message, SSTV and CW can be heard at http://vu3tyg.addr.com/ARRISSAT/rec0805-092348.mp3

Is it possible as the analog transponder that multiple signals on the uplink reduce the downlink signal up to a point where we are unable
to hear anything? As some are reporting using very low power i guess they where probably alone when they made their transmission through
the transponder?

What's was blocking my sound card decoding was as i read the sampling rate i was using on sprectra view with the UK fun dongle. As soon as
i put 48000hz the CW decoder start to decoded but nothing on the TLM screen yet (BPSK). I manually track the doppler shift and it not seems
to be very critical but i'm still in the dark about the BPSK data?

Could be this is the missing link explaining why i burn 2 preamp in the past? but i always put the power knob at minimum when i turned
off the 847. I will have to test it as i measure about 5W even if the RF power is set to 0!! Full power i'm not sure but even 5W is enough
to kill a preamp

>space suits. The battery is designed for a lifetime of 5 deep charge-discharge cycles when used in the spacesuit.

>Using it in a spacecraft going through 14 shallow charge-discharge cycles per day is new territory.

12 days since activation time 14 shallow charge-discharge cycles per day =168 shallow charge-discharge cycles "Is shallow = normal charge-
discharge?"

Some specs:

Silver-zinc batteries are available off-the-shelf and have a higher specific energy (130 Wh/kg) and density (240 Wh/litre) than most other
commonly available secondary batteries. High cost, limited cycle and shelf life, and a long recharging process reduce its overall
attraction. While at normal discharge rates, 40 to 50 cycles can be expected from the battery, this reduces to 10 or 15 at high discharge
rates. Cycle life is also reduced if the battery is discharged below 80% of rated capacity and thus, a 20% reserve is required at the end
of the mission. Silver-zinc batteries have been used extensively in AUVs and their performance is reliable and documented. Their high cost
and short life have, however, prompted consideration of alternative technologies.

P.S. At 13 Aug 2011 04:44:03 UTC ARRISat-1 High Power mode has been reported over Australia

4353. AMSAT at Chaos Communication Camp 2011

Yahoo group: eu-amsat
Date: 2011-08-13 22:15:32 UTC
From: Trevor .
Topic: 4353 Message: 4353

Today Mario Lorenz DL5MLO from AMSAT-DL gave a presentation on Amateur Radio Space Communications as part of the Hacker Space Program track at the Chaos Communication Camp 2011.

Mario's talk titled 'From OSCAR 1 to Mars and beyond - Amateur Space Exploration – The last 50 years, now, and the future' was given to hackers at the Chaos Communication Camp which ran from August 10-14 at Finowfurt near Berlin, Germany.

He described how Radio Amateurs have been building and operating satellites for almost fifty years now, and we are aiming for more. Building satellites has always been challenging and involves using technology in creative ways.

He explained what AMSAT is, what has been achieved in the last fifty years, and what is being worked on now such as the Amateur Radio Mars orbiter P5A.

ARRISat-1 was mainly in eclipse over North America since the launch but starting August 15 the first orbits over NA will be out of eclipse
and if the batteries can hold and the inside temp does not cooked the electronics we will have a chance to listen and work it at a more
suitable time slot instead having to set the alarm clock in the middle of the night...Plus we will have the high power.

We all hope for the best but as projected we already exceed the +- 8 days life expectancy lets say we lived on borrowed time.

4355. AMSAT-DL Video Presentation

Yahoo group: eu-amsat
Date: 2011-08-15 10:51:42 UTC
From: Trevor .
Topic: 4355 Message: 4355

Thanks to the hard work of volunteers from the British Amateur Television Club (BATC) the video of the AMSAT-DL presentation given by Peter Guelzow DB2OS, including an update on P3E, to the AMSAT-UK Colloquium is now available.

You can watch the video online at http://www.batc.tv/
Click on the 'Film Archive' icon
Select 'AMSAT 2011' from the Category drop down menu
Click 'Select Category'
Select video 'AMSAT-DL Presentation'
Click on 'Select Stream'
Click the play icon '>' on the player
Clicking on the icon to the left of the player volume control will give you full screen display.

You can also download the video file to your PC it is at
http://www.batc.tv/vod/AMSAT-DL.flv

The PowerPoint slides are at
http://www.uk.amsat.org/wp-content/uploads/colloquium 2011/AMSAT-DLGuildford2011.pdf

AMSAT-UK publishes a colour A4 newsletter, OSCAR News, which is full of Amateur Satellite information.
Join online at http://tinyurl.com/JoinAMSAT-UK/

The Spring OSCAR News can be seen at
http://www.uk.amsat.org/on_193_final.pdf

Topic: 4357 Message: 4357

On my web page i put the last TLM screen "ARRISat-1 TLM 08/16/2011 0041 to 0051UTC" counter has resetted but batteries are still at 35V but
instead of charging they are "discharging" and for how long they will keep their charge in full sun and in High Power???

Anyone can give me the mass area and initial launch altitude of ARRISat-1?

Thank's

Hello Luc

With latest Keplerian data the altitude in Apogee is 394 km and in Perigee 376 km. Its a little too early for a "chicken contest".

This is the Russian Homepage for RadioSkaf-V or ARISSat-1. The English version you can reach at http://radioskaf.ru/en/ . Kedr is the name given by the space agency Roscosmos. But RadioSkaf-V is the name given by the Russian project group. There is also RadioSkaf (SuitSat-3) in pipeline, see http://radioskaf.ru/en/suitsat3/

> Appears to me to say that RS-3 was on the same launch as RS-1 and RS-2 and Kosmos-1045 in 1978 but that it failed although it wasn't announced at the time - am I reading it correctly?
>

Radio Sputnik 1 + 2 were launched at 26.10.1978 and had 2m/Shortwave transponders on board. I don't know the band, maybe 10m.

RS-1: http://nssdc.gsfc.nasa.gov/nmc/masterCatalog.do?sc=1978-100B
RS-2: http://nssdc.gsfc.nasa.gov/nmc/masterCatalog.do?sc=1978-100C

Radio Sputnik 3 - 8 was a cluster launched at 17.12.1981. They had, excluding RS-3+4, also 2m/Shortwave transponders on board. The lifetime was 7 years in maximum. No URL known.

Hi Thomas,

The reason for using a Google English version of the Russian language site is because only a limited subset of the information is available in English. For instance the Forum section is Russian language only.

It is the first time I've seen it mentioned that RS-3 was in fact launched with RS-1 and RS-2 but failed to respond. The failure was not aknowledged at the time and the RS-3 number was re-used a few years latter for one of the sats in the cluster.

The Forum section of http://tinyurl.com/RadioSkaf contains discussions on passive stabilization for a future satellite. Also speculation on the feasability of a digital TV downlink at 2.4 or 5 GHz.

Hi Thomas,

By RS-1, 2 and 3 I was refering to the satellites launched in 1978 with Kosmos-1045. History is one of my interests and the mention in the forum of RS-3 being launched with RS-1/2 differed from what I had previously believed.

The Forum references to axis stabilisation and discussion on use of microwave bands relate to a future satellite presumably been built at the Southwest State University, Kursk.

You are right, Radio Sputnik 3 (RS-3) was launched later as I mentioned before, in a cluster of RS-3 thru RS-8.

Yes it looks like a new mini satellite but I didn't spot any reference to linear transponders in the Forum.

I presume Southwest State University, Kursk are getting funding for RadioSkaf from UNESCO.

I see that the UNESCO site says

"The KEDR satellite is an inaugural step in a comprehensive program to construct and operate a mini satellite under the UNESCO Satellite for Science Education and Basic Science project. "

Could be this is the missing link explaining why i burn 2 preamp in the past? but i always put the power knob at minimum when i turned

off the 847. I will have to test it as i measure about 5W even if the RF power is set to 0!! Full power i'm not sure but even 5W is enough

to kill a preamp

4368. Soyuz-U - Progress M-12M

Yahoo group: eu-amsat
Date: 2011-08-24 14:41:14 UTC
From: Luc Leblanc
Topic: 4368 Message: 4368

excerpt from SPACEFLIGHT NOW

An "emergency situation" occurred during today's launch of a robotic Russian resupply ship headed for the International Space Station,
preventing the Soyuz rocket from placing the freighter into orbit.
Liftoff of the Soyuz booster carrying the Progress vessel from the Baikonur Cosmodrome in Kazakhstan occurred at 9:00 a.m. EDT (1300 GMT),
beginning Russia's 44th such cargo delivery mission to the space station.

But the Russian space agency says a problem with the upper stage propulsion system caused a premature shutdown and the vehicle's
catastrophic failure.

Heard that the remains crashed about 300KM from launc pad?

4371. EDUSAT

Yahoo group: eu-amsat
Date: 2011-08-30 18:51:41 UTC
From: Trevor .
Topic: 4371 Message: 4371

Email below was posted to the CubeSat reflector. It would appear that Italy is allocating frequencies in the Amateur Satellite Service segment to non-Amateur satellites.

Their website says
http://www.gaussteam.com/index.php?option=com_content&view=article&id=91:unisat-program&catid=29:unisat&Itemid=195

"The communication system uses frequencies in the 145MHz band to communicate from ground to satellite (uplink) and frequencies in the 435MHz band for communications from the satellite to earth (downlink). It also provides the S-band."

The implication is that this non-Amateur satellite is using an Amateur Primary allocation for command and control uplink.

73 Trevor M5AKA

This is the GAUSS group which is in charge of Edusat satellite.

We want to calm down Giulio: Edusat mission is carrying on flawlessly. We have communicated with it and he told us that the weather is a bit chilly but the panorama is great.

We have seen that many wrong informations are reported on the web. For example, all the radio frequencies are wrong. Edusat is not a radioamateur satellite and has an experimental license for communicating.

We didn't thought our satellite could be so interesting for the space community. Thank you for giving us so much attention.

Hello Trevor

I fully agree. We had many discussions here in the group about this theme, last I was reviled - "this is not illegal". I thought this is a place for a free meaning.

Anyway, UniSat-3 from La Sapienza Uni Rome was also an same intruder, legal or illegal. And the known Russian satellites with DOKA-B transponder uses also the 2m HAM frequencies for remote uplink.

Hmmm... hopefully this satellite operates on commercial frequencies !
Yes, it is NOT a radioamateur satellite. My information from IARU is, there was an experimental licence given for 435.750 MHz (http://www.amsatuk.me.uk/iaru/informal_detail.php?serialnum=202)

During the last weekends I listened on this QRG but heard nothing.
The NORAD number for Keplerian data is 37788.

If they disclose their frequencies probably not but there is surely a way to find the frequencies they are using as something at the government level surely give them some king of autorisation to used their commercial frequencies...? Normaly the Italian Ministry of Communications should posted or make available those frequencies somewhere? EG:maintains the national Register of communications operators

That is the danger.

The previous satellite UNISAT-4 from Gauss was on the ill fated launch of July 26, 2006.

Although it was a non-Amateur satellite it used Amateur Satellite Service frequencies for the uplink and downlink.

When the Dnepr launch failed UNISAT-4 was lost along with a Russian Federation satellite Baumanets that is belived to have been using Amateur Satellite Service frequencies and 14 Amateur Satellite Service CubeSats.

4375. IARU-R1 - Disconnect D-Star Repeaters Violating Bandplan

Yahoo group: eu-amsat
Date: 2011-08-31 22:34:00 UTC
From: Trevor .
Topic: 4375 Message: 4375

Edition 58 of the IARU Region 1 VHF-UHF-UW Newsletter publishes the notes from the key C5 committee meeting at the IARU-R1 Sun City conference.

There are a number of Italian repeaters operating in the Amateur Satellite Service segment from 145.8-146.0 MHz causing interference to the uplinks and downlinks of Amateur Radio satellites. Among them are:

D-STAR:
IR0MA 145.99375MHz -1.975 Roma, Lazio
IR7AZ 145.97500MHz -1.250 San Giovanni Rotondo , Puglia

Also these Italian repeaters using other modes:
FM: IR0CK 145.8500MHz -0.600 Roma (Internet Linked)
Echolink: IQ0FP 145.8875MHz Node 522 131
Packet: IK4MTK-6 145.975MHz Parma, North Italy

The IARU-R1 Sun City conference C5 committee meeting notes say:

SC11_C5_16 – D-Star in Italy using SAT-Band

IARU R1 stresses the importance of satellite service and band plans also in case of the introduction of new modes. It is recommended to disconnect repeaters/nodes from international D-Star network if these are operated in contradiction to IARU-R1 band plans.

Action points:
1. Write the repeater operator to remove out of satellite segment.
2. Inform the trust server operator of the IARU bandplan breach made by the use of the repeater.
3. Inform the government about the repeater and request them to remove the repeater.

Action for the chairman OE1MCU

Voted in favour: All unanimous in favour

4377. IARU AC Meeting Summary

Yahoo group: eu-amsat
Date: 2011-09-04 10:27:37 UTC
From: Trevor .
Topic: 4377 Message: 4377

The IARU administative council meeting took place in Sun City on August 19-20 and the summary has now been released. The Amateur Satellite Service is mentioned in several places.

Among them is the expansion of the 70cm CubeSat segment:

"6.3. Owing to his presence in Sun City for the regional conference, IARU Satellite Adviser Hans van de Groenendaal, ZS6AKV, presented his report in person and supplemented his report with oral remarks. He mentioned that educational institutional satellites using amateur radio frequencies were increasing. The Satellite Advisory Panel has expanded the CubeSat band from 437.305 – 437.505 MHz by 100 kHz to 437.605 while
taking into account certain ARISS preferred slots. He mentioned the opportunity to convert the CubeSats to amateur usage upon completion of the educational institutional experimental usage and in this way anticipated more satellite availability for the amateur-satellite service."

Read the 2011 IARU Administrative Council Summary Record at
http://www.iaru.org/2011ACSummaryRecord.pdf

Notes of the IARU Region 1 C5 committee meeting that took place August 14-16 have been published in the VHF-UHF-MW newsletter Editon 58. The Amateur Satellite Service is mentioned, see
http://www.oevsv.at/export/oevsv/download/UKW/Newsletter_58.pdf

4378. IARU Region 1 Minutes of the Final Plenary

Yahoo group: eu-amsat
Date: 2011-09-04 10:47:50 UTC
From: Trevor .
Topic: 4378 Message: 4378

The minutes of the Final Plenary of the IARU Region 1 meeting held in Sun City have now been released. Among the satellite releated items are:

SC11_C3_Rec _02 – Document SC11_C3_37a
To add to the constitution
A.1.3.11 Protection of the fundamental, natural and finite resource “frequency spectrum,” to keep it clean and undisturbed from man-made electromagnetic disturbances causing harmful interference to the amateur service and the amateur satellite service.

SC11_C5_Rec_10 - SC11_C5_16
D-Star in Italy using SAT-Band
Escalation Procedure:
1. Write the repeater operator to remove out of satellite segment.
2. Inform the trust server operator of the IARU bandplan breach made by the use of the repeater.
3. Inform the government about the repeater and request them to remove the repeater.
Proposed by OeVSV, seconded by REF. Approved unanimously.

SC11_C5_Rec_23 - SC11_C5_44
VHF Handbook Satellite Chapter
Removal of the existing Satellite chapter and replace with the attachment of paper 44.

SC11_C5_Rec_26 - SC11_C5_48
IARU satellite coordinator co-worker
Willi Vollenweider, HB9AMC, prepared the paper. Stefan L. Streif, HB9TTQ, introduced the paper. Graham, G3VZV, confirmed the need for this support. It would be best to involve Hans van de Groenendaal, ZS6AKV (the current coordinator) in this regard. Then ask Willi, HB9AMC, to contact Hans directly to work together in developing the youth satellite programme. Stefan Dombrowski, ON6TI, can also be involved. Hans, ZS6AKV, will be asked to include Willi and Stefan as co-workers into the Satellite ground station network for university satellite projects.
Proposed by USKA, seconded by SARL. Approved unanimously.

IARU R1 Minutes of the Final Plenary, August 17, 2011

4379. Radio hams tune in to space airwaves

Yahoo group: eu-amsat
Date: 2011-09-05 11:19:13 UTC
From: Trevor .
Topic: 4379 Message: 4379

John Heath G7HIA has written an article about amateur radio space communications for the October edition of the British Interplanetary Society magazine Spaceflight.

The Spaceflight description says:
"Radio amateurs have always been keen to exploit new means of communication and John Heath [G7HIA] provides a fascinating insight into how satellite technology has transformed the world of the radio ham soon after the launch of Sputnik right up to the present day."

The article covers the FUNcube satellite, ARISSat, GB4FUN and the FUNcube Dongle SDR.

You can buy the October edition of Spaceflight magazine via
http://www.spaceflightmagazine.com/pages/latest-issue.html

4380. UK Smartphone CubeSat STRaND-1

Yahoo group: eu-amsat
Date: 2011-09-07 21:41:22 UTC
From: Trevor .
Topic: 4380 Message: 4380

The UK Smartphone CubeSat STRaND-1 will carry an Android Smartphone and plans to use data rates of 9k6 or 19k2 bps for the AX.25 packet radio downlink. A software-based speech synthesiser will be included to pay homage to the UOSAT family of satellites.

The 3U CubeSat measures 30 by 10 by 10 cm and weighs 3 kg. Unlike previous CubeSats it will feature full 3-axis control with the attitude an orbit control system comprising a nano-magnetorquer, nano-reaction wheels, GPS receiver, 8 pulse plasma thrusters and a butane thruster.

It would be interesting to know, if such a satellite with this
thrusters can reach a MEO or HEO orbit ?

As I understand it they are only to enable minor changes of position position not to significantly raise the orbit. As far am I'm aware no CubeSat has been able to manouver in space so if they work it'll be a major step forward.

The 3-Axis control using the nano-magnetorquer, nano-reaction wheels is also of great importance.

It's amazing how much equipment they have managed to pack into a 3U Cubesat.

Hello Trevor, I see. But I think its possible to construct such a
satellite. The miniaturization runs forward also for HAM-satellites.
It could be a next project for AMSAT. Or am I too optimistic and we
have to change to short wave for DX operation ? I always hope for
P3E, the hope never dies ...

Yes you are right I think this technology can be used for raising the Apogee but first it needs proved that it works. This is why STRaND is good as it will try out the technology and highlight any design deficiencies.

Like you I keep hoping for P3E and perhaps the Moon project that Peter mentioned may provide the funding to get it launched. I know AMSAT-UK has been contributing funds to the project over the past 7 or so years as have AMSAT-NA and many individuals and of course AMSAT-DL has put a vast amount of money and volunteer effort into it. I hope we will see it launched by 2015.

The future I think will be for 3U CubeSat sized Amateur satellites with a propulsion system rather than the larger sats such as P3E. Launch costs for a 3U into a 500-700km LEO are within the reach of the Amateur community. What is needed is the means to then raise the orbit to an apogee at 1400 km or ideally 7000 km to enable DX working. As well as STRaND there are others developing propulsion systems for 3U CubeSats let's hope they are successful.

4390. IARU Region 1 President to hold Webinar on General Conference

Yahoo group: eu-amsat
Date: 2011-09-16 21:31:34 UTC
From: Trevor .
Topic: 4390 Message: 4390

A webinar on the recent IARU Region 1 General Conference will be held 0930 GMT on Thursday, September 22. Interested radio amateurs can follow the presentation. Register in advance at http://tinyurl.com/September22IARU

The IARU Region 1 site says:

IARU Region 1 President Hans Blondeel Timmerman will inform the members of the CEPT Working Group Regulatory Affairs (WGRA) on Thursday, 22 September 2011 between 1130 and 1230 CEST (0930 to 1130 UTC) on the results of the IARU Region 1 General Conference, held from 13 to 18 August 2011 in Sun City, South Africa.

All radio amateurs in Region 1 and beyond interested can follow his presentation and the discussion at the WGRA meeting in Prague via the Webinar (Web Seminar) facility of CEPT. Virtual participants will also be able to ask questions to the presenter in the Questions & Answers session following the presentation.

The Webinar is be open to all interested parties, however prior registration is necessary to attend it, according to CEPT. Interested parties can register at the following URL:

http://www.cept.org/ecc/groups/ecc/wg-ra/page/wgra-webinar-on-22-september-2011-results-of-the-22nd-general-conference-of-iaru-r1/

There are no special system requirements to particpate in the Webinar.

Additional note: The registration page asks for a name, country and email address as well as organisation you belong to, e.g. national society. When you click the Register Now button it automatically displays a link to use at 0930 GMT Thursday, the same link is also emailed.

From: Trevor .
Topic: 4391 Message: 4391

I was just reading through the IARU information on the CubeSat CXBN, see
http://www.amsatuk.me.uk/iaru/finished_detail.php?serialnum=218

It says:
"All student operators and engineering team members are required to obtain an individual amateur radio operators license."

I was glad to see this encouragement for students to take up Amateur Radio. It appears that some CubeSats that operate in the Amateur Satellite Service allocations may have just one or possibly no Amateurs at all on the team. Perhaps that is the reason that some groups obtain an Experimental licence from their Goverment regulator to use Amateur Satellite Service frequencies.

I hope the example set by CXBN will be followed elsewhere. I do of course realise that in some countries it will be difficult. In one country that springs to mind I believe it can take a year to do the exam with a further wait of up to 1 year for the Government Department to issue a licence.

4392. VO-52 operating in FM

Yahoo group: eu-amsat
Date: 2011-09-22 15:43:36 UTC
From: Francisco Jiménez-Martín Sánchez
Topic: 4392 Message: 4392

Hello All,

As you will probably know, the VO-52 satellite can be operated in FM, so if you want, these two weeks I☐ll be QRV in this mode during the VO-52 passes over my QTH.

These are the details to operate it:

Downlink frequency: 145.920 Mhz. FM (+-doppler)

Uplink frequency: 435.230 Mhz. FM (+- doppler)

Opposite to the other birds, in this one we have to left fixed the downlink frequency and correct the doppler effect in the uplink. Last two days I have tested it and the bird sounds really, really well.

Hope to heard you soon on it,

73 de EA1JM, Fran

PD.- This is a suggestion mode, if anyone prefers to use it on the normal SSB operation, please feel free to do it.

Hello Francisco

Yes, its technically possible to operate VO-52 in FM, it has a bent-pipe transponder. What comes in goes out. BUT !! There is a Gentleman agreement not to use VO-52 in FM for regular QSO's. Except for emergency communication.
Please accept this rule, Thank You Francisco.

4395. AMSAT-UK - Autumn OSCAR News

Yahoo group: eu-amsat
Date: 2011-09-29 21:38:53 UTC
From: m5aka
Topic: 4395 Message: 4395

The autumn edition of the colour A4 newsletter OSCAR News is being posted to AMSAT-UK members this week

As usual it's packed with Amateur Satellite articles:

- Haven't Got A Callsign - regular column by Clive Wallis G3CWV
- Memories of working Astronaut Helen Sharman GB1MIR by Chris Lorek G4HCL
- Louis Varney Cup Presentation to Paul Robinson 2E1EUB
- ARISSat-1 Reception
- USA NTIA WRC proposal for an ITU "Educational" Satellite Service
- ARISSat Update
- AMSAT-UK FUNcube Satellite Testing at RAL
- Syncart geostationary transponder
- Report on First UK National Space Conference 2011
- AMSAT-UK FUNcube Satellite Project Report
- KiwiSAT Current Status

4396. New ITU Service for CubeSats and Nanosats ?

Yahoo group: eu-amsat
Date: 2011-10-01 13:06:39 UTC
From: Trevor .
Topic: 4396 Message: 4396

The latest issue of the AMSAT-UK publication OSCAR News highlights the US NTIA proposal to create a new ITU satellite service for CubeSats and Nanosats.

The proposal seeks one or more frequency bands, totalling up to 10 MHz of spectrum, to support command, control, and data relay for nanosatellites and picosatellites performing a variety of functions.

It proposes that a study be undertaken after WRC 2012 so that the item be placed on the preliminary agenda for WRC 2019. It is unclear where the UHF spectrum for a new ITU service would come from.

Read the NTIA proposal 'Studies for identifying up to 10 MHz of spectrum for space research service in the 400-2025 MHz range for the operation of nanosatellites and picosatellites'.
http://www.ntia.doc.gov/WRC_2012/Documents/NTIA_Proposal/NTIA_Proposal_2011-02-23_8.2(Nanosat).doc

Other NTIA WRC documents can be downloaded from

4397. Neptune TubeSat and CubeSat Launcher

Yahoo group: eu-amsat
Date: 2011-10-04 19:25:26 UTC
From: Trevor .
Topic: 4397 Message: 4397

The October issue of Sat Magazine carries an 8 page article by Randa Relich Milliron, Interorbital Systems Chief Executive Officer, in which she describes the Neptune rockets and their TubeSat and CubeSat payloads.

The first Neptune 9 rocket is planned to launch mid 2012 and will carry 40+ TubeSats and CubeSats. A number of amateur radio CubeSats will be on this launch including Vietnam's F-1 and the Danish EuroLuna, Romit 1.

Hello Trevor and group

UCISat-1 is also manifested, see Launch manifest
http://www.interorbital.com/Launch%20Manifest%20Page%20_1.htm and
http://ucisat.eng.uci.edu/ . Do you know of more satellites with
HAM QRG (I don't write "amateur radio CubeSats") ?

Thanks, I hadn't spotted that one on the manifest. It's on the IARU Amateur Satellite Frequency Coordination pages at
http://www.amsatuk.me.uk/iaru/finished_detail.php?serialnum=65

Sadly none of the sats on the launch are transponder satellites which is what we need.

I'm not clear what the orbit will be. UCISat-1 was planned to go on the Neptune 30 launcher which would have had an orbit of just 310 km resulting in burn-up after a couple of months.

The Neptune 9 launcher may be going into a higher orbit, does anyone know ?

Given it'll be the first launch of Neptune 9 there must be a high probability of launch failure. It took Space-X four launches to get it right.

Hi Trevor,

Thanks for the post.

BTW, for some time I've wanted to thank you for your many informative posts regarding AMSAT-UK and European Amateur Radio related satellite news. So here goes - THANKS!

I'm connected to the satellite industry out here on the West Coast and I must tell you that the "professional locals" out here are very, very skeptical about Interorbital and their chances for success.

I share their pessimism, but you never know. I would dearly love to see them succeed since it could open up affordable launch opportunities for the CubeSat community. Except for some engine firings they have continued to put off the "real" launch, not even being able to pin down their launch site, while several are given. So I'll keep my $8000 in the bank for now.

Regards...Bill - N6GHz

Hi Bill,

Yes I wouldn't part with any money either. They say they are first going to do sub-orbital launches without payloads which given the difficulties would be sensible.

I hope they develop a launch system that works and get sufficient funding from somewhere to sustain the company until they can acheive successful orbital launches.

>
> Stefan, VE4NSA

As in any society there is always conflicting relationship between ages group. For one some are too old and they are living in the past,
and for others they are too young inexperienced claiming their way is the way to go.

Acquiring and gaining experience take's time and patience but today we want immediate results "Plug and play era" discarding others past
experiences.

It's not a question of skills and competence it's a question of minding and learning. Taking short cuts to achieved lower goals can only
lead after couple years to disappointments and lack of interest. That's why those who where lucky to work on HEO satellite says it's the
only one way to go if we want to create a sustainable critical mass of skilled amateur satellite operator.

It's the very true nature of Ham radio to communicate over the greatest distance "DX" those who are satisfied by the fact they can reach a
space cube are in a learning process. That's why those cube sat should be considered an entry class satellite. Exponentially increasing
entry class satellite does not provided on the long term any viable solution aside of saving the furniture.IMHO.

Lets say the better than nothing minding who should be considered as a way to deal with exception is now a standard.

If we want to know where to go we should always also know where we come from! If finding an affordable HEO launcher is an obstacle trying
to avoid instead of facing the obstacle is not a solution its'a more a lack of courage and faith than anything else that's why AMSAT-DL are
still engaged toward P3E and Mars. It takes time and patience.

Ask those who are working EME why they spent a lot of time and money to achieved their goals? they will all tell you this the only way to
go if we want to be able to work the moon HT'S and rubber duckies and tape measure antenna are not enough to reach the far distant moon and
the ultimate "DX" contact. If you just bear in mind this you will be able to understand why those "old" operators wants for you "increased
your range of communication in time and distance" they only wished that you can also enjoyed world-wide communication through satellites.
The chosen words are not always what they should be but bottom line they are only want the

best for you.

4409. FO-29 – status

Yahoo group: eu-amsat
Date: 2011-10-28 20:21:35 UTC
From: Terje Haug
Topic: 4409 Message: 4409

Dear all,

I appear to have missed the reason for FO-29 going silent. In September I filed a report to JARL on the status of the SAT as received in my square, though I did not receive any response. The signal appeared to be deteriorating during August and September, and me had my last confirmed QSO on September 17th through FO-29.

I have noted it was reported silent on the SAT monitoring web page of KD5QGR as well not in the AMSAT web page listing anymore.

So to anybody knowing something about the status; is it a control station shut down for a period of time, or has FO-29 ceased to operate?

Hello Terje

Because of long eclipses, FO-29 had shut down itself via its under
volt control (UVC). I don't know the actual status. The best will
be you observe the beacon on 435.7964 MHz when FO-29 is sunlit.

Luc, some information from BAA-RAG:

Yesterday evening (UK time) astronomers using NASA's Deep Space Network antenna in Goldstone, California captured new radar images of Asteroid 2005 YU55 approaching the Earth. The images were taken about 19:45 UT on November 7 when this very dark object was still some 3.6 times the distance of the Moon away. Details can be found at:

http://www.nasa.gov/mission_pages/asteroids/main/index.html
http://www.nasa.gov/mission_pages/asteroids/news/yu55-20111107.html

NASA scientists will continue to track 2005 YU55 for at least four hours each day until November 10. Radar observations from the Arecibo Planetary Radar Facility in Puerto Rico will begin on November 8. The object will make its closest approach to Earth on November 8 at 23:28 UT at some 324,600 km or 0.85 the distance from the Moon to Earth.

Although UK observers are well placed to watch the last few hours of its approach, the weather prospects here are pretty dire for the entire country. However there are two 'live' broadcasts being organised via the Slooh organisation which you may be interested in. Details are at the Slooh website / Twitter at:

http://events.slooh.com
http://twitter.com/#!/Slooh

In particular, two "radio shows" are planned for tonight (8th/9th), the first at 21:00 UT will hopefully show live images of 2005 YU55 using the Slooh Half-Metre telescope on Mount Teide, Tenerife, weather permitting; the second, at 02:00 UT (on the 9th) will be using Slooh's partner's 24" telescope based in Arizona. Both shows will be hosted by Bob Berman of Astronomy magazine. Dr. Robert McMillan (2005 YU55's discover) will be appearing as a guest during the first show. There is a possibility that, as the BAA's Asteroids and Remote Planets Section Director, I may also take part on the first radio show from 21:15 UT.

I just got a flash is it possible the moon bounce signal where reflected on this
"ionosphere" instead of the moon surface or both or is it
the moon libration signal often reported by moon bouncer a kind of signal mix the one
reflected over the surface and the one reflected by
the ionosphere back to the moon surface working against each other?

Hello group

I'm sceptical in opposite to this experiment. I think it's an "one way ticket" for this commercial(?) institute. Or does this institute contribute a plasma thruster motor for an AMSAT satellite later ?

The institute is part of the Federal Space Agency Roscosmos, who provided the ARISSat launch, and the experiment was devised by a radio amateur on their staff.

I agree with you that we must be on our guard against the use of amateur radio spectrum for commercial gain. Swatch was one such company that tried that 12 years ago.

Hello Trevor

OK. The "story" about Swatch was evident. But today also commercial groups jumps on the CubeSat "train" and mean "ah, amateur radio frequencies are free for use!". So we must be heavily on our guard and must make strong differences between Universities and commercial "jumpers". Universities are accepted now, but not from all (this is an other story).

But there are also "black sheep's" of Universities. Its very hard to make differences. I read from an American initiative from IARU to ITU for different frequencies, not in the HAM-band, for University/school satellites. May this help. Have you any specific Infos ?

We should not discard this commercial advertisement option it can help a lot to finance a launch we are in 2011 near 2012 and things are
changing we should adapt as the French government does on the D-STAR protocol in France

Timescales indicate at best it would go before ITU in 2019. Even if successful it may be several years after that before such a band(s) can be used.

All I know is what is contained in these proposals -

NTIA 10 MHz in 400-2025 MHz Proposal

This is about a designated band that can be used for operations, including command, control, and data transmission. Note it says band and not bands you would have though they would have wanted two bands say 50 MHz+ apart to enable full duplex operation of the downlink and the command and control uplink.

James Miller G3RUH remotely reconfigured the tracking and receiving system at the AMSAT-DL Amateur Radio facility in Bochum, Germany to receive the NASA Mars Science Laboratory X-Band telemetry. The signal was received automatically, no-one had to be physically on-site.

Another remarkable acheivement by the AMSAT-DL team.

There is even a more simple solution just use what it is already installed aboard ISS a cross band repeater and a lot of other piece of
amateur radio equipment.

And for the next satellite a fail safe system who can run the satellite when batteries are depleted EG: something very basic who can run
when the satellite is in the Sun.

There was a Acceptable Use Policy for the AMSAT Public Mailing Lists since January 5, 2010. As i always suspected it was only put in force
to silence any opinions not favorable to AMSAT-NA. We just see that clearly with the actual saga this policy is not working revealing this
so called "acceptable use policy" is a disguised way to censored the AMSAT-NA BB.

http://www.amsat.org/amsat-new/images/fck_images/AMSAT%20AUP.pdf

The good thing when you kick a bag of garbage rodent some times come out... I was always asking myself who they are? We have a fairly good
idea now.

>My apologies for breaching any etiquette of this -bb. I have also sent an apology to
>Gould as moderator.

I don't called that thing a moderator as i will refrain to used bad combination of words as "scum bag" words who are not appropriated on
any mailing list not even this combination "shut the fuck up dumbass, there will be nobody there on FM" who even pass through freely the
"Acceptable Use Policy for the AMSAT Public Mailing Lists".

I don't know how an AMSAT-NA member can accept that and continue to send money to support a so undemocratic organization?

AMSAT-NA is only focusing on LEO satellite always invoking a financial matter and ITAR as anything other hollow false pretexts to avoid to
regroup and back AMSAT-DL with the P3E project. Instead of working in a team to secure a launch they only work to please a small group of
people running for grids on a space FM repeater.

The VUCC ARRL rules prohibits repeater use making an exception for "satellite" probably due to AMSAT-NA pressure as you see below
aeronautical mobiles contacts does not count a satellite is just higher and should never be accepted as they are repeater.

Contacts with aeronautical mobiles (in the air) do NOT count.

For VUCC awards on 50 through 1296 MHz and Satellite, all contacts must be made from locations no more than 200 km apart. For SHF awards,
contacts must be made from a single location, defined as within a 300-meter diameter circle.

No contacts through active repeaters are permitted, except for Satellite Awards.

Bottom line the only good use of AO-51 was on the L and S band and SSB/DATA experiments both single channel U/V used at 90% for grid
chasing where a total non sense only increasing the frustration level among the "newbies" who quit the satellite fiels as fast the come to
it....

For the grids chaser just check the rules again and check your logs?

"For VUCC awards on 50 through 1296 MHz and Satellite, all contacts must be made from locations no more than 200 km apart. For SHF awards,
contacts must be made from a single location, defined as within a 300-meter diameter circle."

What is not permitted on a LEO can be valid on an HEO!!!

Another very proud member of the gallbladder Brigade!

4431. Get digital data received by kenwood to hyperterminal

Yahoo group: eu-amsat
Date: 2011-12-08 10:29:01 UTC
From: Pushkar
Topic: 4431 Message: 4431

Hello!
I am totally new to this group and to ham radio as well. My problem might seem to be very basic, but any help would be highly appreciated.
I have a Kenwood TS2000. A CC1020 transmits FSK modulated packet data at 437MHz at a baud rate of 1200. I need to receive this data via kenwood and get the digital data as the final output.
I tried really hard, but to no avail. :(
It would be great, if I could get a step by step procedure to how exactly, I can get kenwood to echo on the hyperterminal, the fsk demodulated digital (raw) data sent by the cc1020.

Hello Pushkar

First - Are you a radio amateur ? Please give us your call if you have one.

Your TS-2000 operates with Packet Radio 1200 bps and 9600 bps.

Packet Radio 1200 bps means:
- Modulation AFSK (Audio Frequency Shift Keying)
- Communication Protocol AX.25 (AmateurX.25)
- Data Rate 1200 bit/second

Packet Radio 9600 bps means:
- Modulation FSK (Frequency Shift Keying / without tones, binary data stream)
- Communication Protocol AX.25 (AmateurX.25)
- Data Rate 9600 bit/second

This are the two standards for amateur radio 'Packet Radio'.

Your 'Single Chip Low Power RF Transceiver'
(http://www.khalus.com.ua/kh/data/components/chipcon/data/CC1020/CC1020_Data_Sheet_1_5.pdf)
is specified for ISM and SRD, not for amateur radio. The same RF frequency doesn't mean, each device talks with another device.
Hope this helps.

Hello!
Thank you for your prompt reply!
I actually have a very primary question. If I am sending out say 101010... modulated in FSK. (No protocol, nothing) how do I get that 101010... displayed in the hyperterminal, using Kenwood.

Hi Pushkar,

Are you at the Indian Institute of Technology (IIT) ?

If I understand you correctly you are generating a 437 MHz FSK signal.

I do not know the TS-2000 but I think it's internal modem can only receive FM 1200 bps signals. (but I may be wromg about that)

To receive an FSK signal you need the TS-2000 set to USB (single sideband) and then feed the resultant audio output into a PC soundcard and use software to decode it.

It the UK free software called dl-fldigi is used to demodulate 433/434 MHz FSK telemetry used on balloon flights
http://www.southgatearc.org/news/december2011/digital_pictures_sent_from_balloon.htm

you can download dl-fldigi software from
http://ukhas.org.uk/projects:dl-fldigi

Hope I have understood your question correctly.

Enebody know something about this?
Some countries impose severe restrictions on certain aspects of amateur radio. For example the amateur radio satellite community has been particularly affected by US Federal Government ITAR regulations which threaten radio amateurs with jail sentences and six figure fines if they collaborate with radio hams in the rest of the world on amateur satellite pojects.

AFAIK the problem is in the housekeeping and attitude units (IHU),
that are subject to export restrictions. The US government is
considering a revision of the rules for "commercial" satellites, but
it is not clear if the amateur and universitary satellites are included or not.

It appears the restrictions extend far wider than just IHU units.

As I understand it just talking to people outside the USA about certains aspects of satellites could bring American citizens into breach of the regs.

IARU Region 3 report that a few years ago AMSAT-NA advised its members to stop cooperation with the KiwiSat project due to ITAR concerns.

It's just 7 CubeSats and the ALMASat Microsatellite.

The plan was for 9 CubeSats to be launched on Vega but only 7 CubeSats were delivered.

Neither OUFTI-1 or AtmoCube will be flying on Vega in January. Gunter's space page doesn't have any launch listed for them.

and ARISSat-1/KEDR ;-)

No satellite from the Russian Federation has ever gone through IARU frequency coordination.

It is pleasing to see that an increasing number of groups around the world are now using the IARU frequency coordination process and I hope that more groups will be able to make use of this facility in the future.

The use of the Progress M-13M vehicle in this way provides a new means of getting satellites into orbit. I hope the deployment is successful and that there will be other opportunities in the future to deploy more satellites.

4474. New HamSatDroid version avaliable

Yahoo group: eu-amsat
Date: 2012-01-29 14:47:30 UTC
From: David Johnson
Topic: 4474 Message: 4474

Hi,

There is a new version of the free HamSatDroid app now available on the Android Market.

I've changed it:
- to use my SGP4 implementation, as used in GENSO.
- plot three orbits ahead on the map
- plot the footprint
- take keps from celestrak

I've got quite a few more changes in development, thanks to the feedback we've had from the existing users.

Opinions are sought about making a small charge and paying the income into satellite buidling funds
and supporting a server which might be introduced to improve functionality of the app.

Nitin, do you really need 1 Hz steps ? I have an other rig, but do
a manual step at your rig. Can you get 1 Hz steps there ?

Nitin, do you really need 1 Hz steps ? I have an other rig, but do
a manual step at your rig. Can you get 1 Hz steps there ?

4480. Vega cubesat frequencies ?

Yahoo group: eu-amsat
Date: 2012-02-04 11:08:59 UTC
From: Marco IK1ODO -2
Topic: 4480 Message: 4480

Has anyone already compiled a list of frequencies used by the
cube/nanosatellites in the first Vega launch?
I mean :

- Xatcobeo (a collaboration of the University of Vigo and INTA, Spain)
- Robusta (University of Montpellier 2, France)
- E-St@r (Politecnico di Torino, Italy)
- Goliat (University of Bucharest, Romania)
- PW-Sat (Warsaw University of Technology, Poland)
- MaSat-1 (Budapest University of Technology & Economics, Hungary)
- UniCubeSat GG (Universit? di Roma 'La Sapienza', Italy)

Plus ALMASAT-1 and LARES (that is passive, of course)

Hello Marco

Mineo, JE9PEL, has compiled such a list, see
http://www.ne.jp/asahi/hamradio/je9pel/esa9cubf.htm . But its not
actual anymore, your list is correct. SwissCube-2 was cancelled and
OUFTI-1 was not delivered at the right time. It will ride on an other
flight.

See also my list on AMSAT-DL homepage:

Positive for Unicube (but only 1 packet seen, and
I'm not sure 100%), MASAT-1, Xatcobeo, Almasat-1
and PW-sat. No signals so far from e-st@r, Robusta and Goliat.
See http://bit.ly/yY6Wne - those are the signals
received in UHF during 1st pass at 1354z, elevation only 7°.
I checked other two passes, but no signals from the other three so far.

They first appeared on the Neptune 9 manifest a year ago, or maybe longer, but have only recently appeared on the HTV-3 manifest. So far Gunters Space Page is the only reference I've seen to them being on HTV-3.

I can only presume that the tried and tested HTV-3 with a deployment at 380 km giving a 5-6 month lifetime looked a better deal than the Inter Orbital launch, given that Inter Orbital have never had a successful space flight and are only planning, if it works, to go to 300 km, giving a satellite lifetime of about a month.

Subject: HAMSAT VO-52 Status

Hello All,
Looking at the discussions and the concerns expressed about VO-52,all
that I can share at this moment is 'HAMSAT VO-52' is in 'Excellent
Health' after recovery operations. Right now, it is under observation.
However, decision about switching 'ON' the transponder is pending
clearance. Decision expected in other couple of days.
The user community will be informed well in advance about the
transponder switching.

Note:

'HAMSAT VO-52' is the property owned, operated and maintained by the
Government of India/ISRO. Hence, unlike other amateur radio satellites
owned, operated and maintained by non-governmental agencies, detailed
information cannot be shared with anyone in accordance with the
prevailing governmental regulations.

Hope this bit of information would remove the doubts and concerns
about the HAMSAT VO-52 status and this is shared with you all with
the concurrence of 'HAMSAT VO-52' Operations Director, Mr. T.
Parimalarangan.

with regards,

Mani, VU2WMY

Hello Nitin

Thanks for the info in this group. On AMSAT-BB it looks to me
like children want their Lolly back.

Hi Domenico,

VO-52 health is monitored on a daily basis by ISRO, the telemetry and all telecommand is on non amateur radio frequencies and hence is managed by ISRO.

Subject: Re: [amsat-bb] Re: VO-52 Not Heard

Hi Nitin, VU3TYG

I can't understand if AMSAT-India or ISRO is able and equipped and entitled to command VO-52

Since both transponders ,the AMSAT-India and Duch transponders on board of VO-52 have not channel telemetry it is impossible to know the battery conditions because the beacons of AMSAT-India transponder is only a steady carrier and the Duch transponder I remember has been used for only few days at the beginning and the beacon was transmitting only the same voice message from William Leijenaar PE1RAH.

Now who take care to monitor the battery and transponder conditions of VO-52 without to have a channel telemetry ?

Who is entitled and able to send a command to VO-52 and switch from the AMSAT transponder to the Dutch transponder ? AMSAT-India or ISRO ?

Have AMSAT-India or ISRO already tried to switch from the AMSAT transponder to the Duch transponder ?

Have AMSAT-India a VO-52 command station or not ?

Please let us know.

All,

We are aware of the current situation. Myself and Mani, VU2WMY tried listening to the beacon and work thru the satellite during the 04:05 UTC pass over India (6 degree elevation) on Feb 29th but nothing was heard. I will post further updates when I hear from ISRO on the current status and next steps.

Please submit your reports at www.oscar.dcarr.org or drop me a email.

All,

FYI.

Details of the Second Payload Transponder on VO-52.

Uplink frequency : 435.250 MHz
Downlink frequency : 145.900 MHz
Beacon : CW at 145.859330 MHz (145.86 MHz)
Output level of Beacon Carrier : 18 dBm

Subject: [VUHams] VO-52 PE1RAH Trxp Switching 'ON'

Dear VO-52 (HAMSAT) users,

On behalf of HAMSAT VO-52 Mission Director, Operations Director and the entire HAMSAT Team, I take pleasure to inform the user community that;

After the 'In-Orbit Maintenance Operations' the decision to turn 'ON' the payload transponder was taken and accordingly;

The Transponder No 2 i.e. The Dutch Transponder made by William Leijenaar PE1RAH would be switched 'ON' at 13:51 UT on 08.03.2012 during orbit # 37006 over India.

A 'Critical Comparative Signal Report' between the Indian and Dutch transponder would be of great help for further evaluations and necessary actions for the maintenance the transponder in good and healthy condition for better services and also, the inputs would be very valuable to the respective transponder designers.

We all hope, Williams PE1RAH would be very happy with our decision and behalf of every one here in India involved with project, wish Williams and his transponder all the very best and good luck.

Thanks to AMSAT-India (Nitin VU3TYG) for the all the help and co-ordination provided.

Note:

Below pasted is the 'Official Announcement' received from Mr.Parimalarangan, Operations Director VO-52 (HAMSAT).

ANNOUNCEMENT REGARDING SWITCHING ON OF THE PAYLOAD TRANSPONDER-2 (Dutch) ONBOARD HAMSAT

I HAMSAT was launched on 5 May 2005. Since then, the Indian Payload transponder is in operation, but for a brief period, wherein, Dutch Transponder was kept ON

II Now, it is planned to switch ON the Payload Transponder-2 (Dutch) on 8 March 2012 / 13:57 Hrs. UT

III Details of the Second Payload Transponder:

Uplink frequency : 435.250 MHz
Downlink frequency : 145.900 MHz
Beacon : CW at 145.859330 MHz (145.86 MHz)
Output level of Beacon Carrier : 18 dBm

IV Please send your feedback to tprangan@... (Mobile: 0-9480 333 563)

Subject: [amsatindia] VO-52 Trxp Switching 'ON' Postponed

Dear Friends,

Thanks for the encouraging and supportive expressions!

Unfortunately, we are sorry to inform that the 'Expert Committee' overseeing the VO-52 (HAMSAT) performance has advised to extend the 'Observation Period' by an other week.

Hence, the decision to switch on the transponder # 2 is now put 'ON HOLD' till further notice. In-convenience caused to the users is regretted.

This latest decision is just only a postponement and nothing to worry about the health of the spacecraft. We re-assure you all that VO-52 is very strong and in a 'Perfect Health' condition.

We do hope that the technically competent user community would understand the situations involved with any Space related activities.

73 de

Mani VU2WMY

The following is the latest announcement received from Operations Director-HAMSAT VO-52 at 07:04 Hrs.

Dear Sir,

Switching ON of HAMSAT Transponder-2 (Dutch) is re-scheduled for the next week.
Mr. Subramani VU2WMY, ISAC is requested to convey this message to HAM community.

With Best Regards,

T PARIMALARANGAN

4516. AMSAT-UK Colloquium 2012 First Call for Speakers

Yahoo group: eu-amsat
Date: 2012-03-08 16:44:13 UTC
From: Trevor .
Topic: 4516 Message: 4516

This is the first call for speakers for the AMSAT-UK International Space Colloquium 2012 which, due to the Olympic & Paralympic Games, will be held this year on the weekend of September 15-16, 2012 at the Holiday Inn, Guildford, GU2 7XZ, United Kingdom.

This Colloquium will take place 2 weeks before the planned launch of AMSAT-UK's FUNcube-1 satellite carrying a 435/145 MHz linear transponder for SSB/CW communications.

http://www.uk.amsat.org/colloquium/twelve

AMSAT-UK invites speakers, to cover topics about micro-satellites, CubeSats, Nanosats, space and associated activities, for this event.

They are also invited to submit papers for subsequent publishing on the AMSAT-UK web site. We normally prefer authors to present talks themselves rather than having someone else give them in the authors' absence. We also welcome "unpresented" papers for the web site.

We appreciate that it is not always possible to give a firm indication of attendance at this stage but expressions of interest would be appreciated.

Submissions should be sent *ONLY* to G4DPZ, via the following routes:

e-mail: david dot johnson at blackpepper dot co dot uk

Postal address at http://www.qrz.com/db/G4DPZ

AMSAT-UK also invite anyone with requests for Program Topics to submit them as soon as possible to G4DPZ. Invitations for any papers on specific subjects will be included in the future call. Likewise if anyone knows of a good speaker, please send contact and other information to G4DPZ.

AMSAT-UK http://www.uk.amsat.org/

4522. Need ears to listen for VO-52 right after switch on

Yahoo group: eu-amsat
Date: 2012-03-13 08:51:47 UTC
From: William L
Topic: 4522 Message: 4522

Hi AMSATs,

I received the news that VO-52 will be switched on in a couple of hours from now, at 13:50UTC, (03-March-2012)
Unfortunately the satellite will not pass over central Europe, and I am not able to check the status the first two orbits.

I am looking for hams in Russia, Northern Europe, Canada, USA, or others that can listen for VO-52 right after it is turned on.

! ! ! Please don't use high uplink powers !!! (We don't want it to rise temperature very fast just after cold switch on) ! ! !

Please listen for the CW beacon at 145.860, which is a good reference.
(Audio records and reports are very welcome at ISRO and myself)

73 de PE1RAH,
William Leijenaar

Subject: [amsatindia] HAMSAT VO-52:Transponder 2 (Dutch) Performance Feedback Format

Dear HAMSAT VO-52 users,

Due to hectic official schedules, we were unable to respond and acknowledge 'INDIVIDUALLY' to all those who shared their information, reports, concerns, views, opinions, good wishes and greetings with us during the time of crisis with HAMSAT VO-52 and there after the successful activation of transponder.

Hence, we take this opportunity through this mail, to express our sincere thanks once again to each and every one of you for sharing with us your valuable feed backs and signal reports on the performance of the HAMSAT VO-52 transponder 2.

As mentioned earlier, we are in the process of documenting a 'Anomaly Analysis and Transponder 2 Switch ON' report containing the feed back from users and the same needs to be completed and submitted at the earliest.

In this regard, it is kindly requested to spare a little amount of your precious time to send in your valuable signal reports in the 'ENCLOSED FORMAT'.

Note:

HAMSAT VO-52 Transponder 2 (Dutch) 'Performance Feedback Format' can be downloaded at:

www.amsatindia.org/reports

1.We are in need of signal reports, at least for three more days.

2. Kindly use SEPARATE FORMAT for EACH entry/report/observation.

3. We also request to kindly re-send all your earlier reports/observations that have already been sent to us, using the 'Format Enclosed'.

4. As many as reports can be sent, but we hopefully expect at least one from every user.

4. The dully filled in formats may kindly be sent to ;

tprangan@...

and copied to

wmy@...

We do hope that, you all would bear with us.

I have been on VU-52 on the Dutch Transponder. I have heard the beacon and worked ZL2BX Alan and VK2AYE Graham on the Western pass from here at 0740 UTC time (local 0840 am). The signals were quite good but not as loud as the Indian Transponder. The Western evening passes are too late here around 10.30 pm in the evening.

Hello,

is here anybody who is using SDR for satellite work?

I am using SDR Ensemble + XVRT 2m (for RX). Running Genesis SDR under WinXP on Pentium-4 and EMU0202. Audio stream tests shows input latency 3,3ms and output latency 6,3ms. CPU load 60-90%.

This nearly real-time, but not true real-time. Any advice how perform better? The DSP buffer is set on 512.

Today's recording (poor conditions, no Martin G3YJO)

http://www.ham-radio.ch/kits/sdr-radio.com/mp3/01-Apr-2012-1101%203.750MHz.mp3

The major news is the 2013 launch of Bonag-1, a HEO satellite constructed by the Isle of Man ARS (GT3FLH) at their advanced workshop (meetings every Wednesday). Launch is set for April 1st, 2013 using a spare rocket from the now decommissioned nuclear submarine facility at Foxdale (see below). Frequencies are 2m and 70cms AM *only*. AMSAT-IOM have allocated the name AF-01 to this satellite. More information about this secret project later today.

"Foxdale shipyard is located approximately 1km west of the town. The yard is owned by STX Europe yet operated by BAE Systems. It began operations in October 1927 and is still active today. The three large Cranes can be seen from across the island. Both of the Oasis class cruise ships are being constructed at the yard as well as the Type 212 submarines for the Italian navy. A contract has recently been won to build the 6 Rinascimento class frigates. The yard opens to the sea through the port of Peel, Isle of Man and navigation up the River Neb. A project is underway to deepen The Neb to accommodate the Astute class submarines which are to be serviced in the yard. The current manager of the yard is Donald 'Don' Brown. The Shipyard will not be affected by cuts to the BAE Systems workforce."

Simon Brown, HB9DRV

4545. New Sat Frequencies for Poland

Yahoo group: eu-amsat
Date: 2012-04-05 10:49:01 UTC
From: Trevor .
Topic: 4545 Message: 4545

According to the Polski Związek Krótkofalowców (PZK) website 2400-2450 MHz has now been allocated to the Amateur-satellite Service in Poland. The website also indicates that the amateur radio BRITE-PL satellite, due to launch from Yasny on a DNEPR in October 2012, will be using this allocation.

See http://www.uk.amsat.org/6223

The Amateur Service in Poland was also allocated 70.1-70.3 MHz and 3400-3410 MHz.

Although in some parts of the world (ITU Regions 2 and 3) 3400-3410 MHz is allocated to the Amateur-satellite Service it is not in Europe and Africa. Indeed many countries in thos e continents do not even have an Amateur Service allocation at 3400-3410 MHz so the Polish move to allocate the band for the Amateur Service is a welcome step forward.

4546. SSB Nanosat TURKSAT-3USAT

Yahoo group: eu-amsat
Date: 2012-04-07 10:12:59 UTC
From: Trevor .
Topic: 4546 Message: 4546

The press story says the group hope to launch the satellite by the end of the year, however, I've not seen it listed on any launch manifests does anyone know which launcher they hope to use.

TURKSAT-3USAT certainly looks a very interesting Nanosat.

It features a 145 to 435 MHz linear transponder (apparently dual redundancy) and is also using Super-Capacitors as well as lithium polymer batteries.

See the story at http://www.uk.amsat.org/6288

Topic: 4547 Message: 4548

Hi Luc,

They say a downlink of 470 MHz was used for the earlier Kwangmyongsong-2 so I guess Kwangmyongsong-3 will also use the same band.

No doubt if the launch is successful then the exact frequency will be widely publicised.

From: Trevor .
Topic: 4556 Message: 4556

I liked this story at http://www.uk.amsat.org/7201

Having experienced the fun of space maybe in years to come we'll see some of those young people following it up with something more sophisticated.

A number of other Scottish schools also took part in the competition, see http://www.fistraltraining.co.uk/index.php?option=com_content&view=article&id=126&Itemid=75

Of course what we all want to see is something in a high (>1000 km orbit) carrying a transponder but there are several developments in the pipeline that may eventually lead to that. Certainly the ion motor that the Danish amateur group are using in their 2U CubeSat is a step in the right direction.

4565. 2nd Call For Speakers for AUK International Space Colloquium

Yahoo group: eu-amsat
Date: 2012-05-28 20:11:00 UTC
From: Trevor .
Topic: 4565 Message: 4565

This is the second call for speakers for the AMSAT-UK International Space Colloquium which, due to the Olympic & Paralympic Games, will be held this year on the weekend of September 15-16, 2012 at the Holiday Inn, Guildford, GU2 7XZ, United Kingdom.

AMSAT-UK invites speakers, to cover topics about micro-satellites, CubeSats, nano-sats, space and associated activities, for this event.

4566. Status of AlmaSat ?

Yahoo group: eu-amsat
Date: 2012-06-04 15:36:28 UTC
From: Thomas Frey
Topic: 4566 Message: 4566

Hello to Italy

Has anyone any infos about AlmaSat ? I've never heard it on 437.465 MHz.
Is it QRV on 2407.850 MHz ?

Thanks Trevor for the info. I read never an official info about the
malfunction. Armando's, N8IGJ, answer on AMSAT-BB was also vague.
I would do tests with my mode-S converter via sat.

As far as I know it has never been heard on S-band. It stopped transmitting after a few days, I was able to decode some packet from the UHF channel. Then it stopped transmitting and responding to commands. The last communication I had with the team has been on Feb. 27. For an update you may contact the team, Alessandro Avanzi <a.avanzi@...> and Fabio Antonini <fabio.antonini@...>

Hello All

More infos: Peter, DB2OS, has made a contact to China and CAMSAT and offered a cooperation between AMSAT-DL and CAMSAT, also with P3E. The offer was accepted benevolent.

The launch of CAS-2 is planned for 2014 in an orbit of 1000 km hight with an inclination of maximal 12 degrees. The primary non-HAM payload is voluminous, so only a FM Repeater has room in it.

This are in-official news !

Thanks for the info Thomas,

With an inclination of 12 degrees it looks like it won't be receivable in the UK, however, it's really good news that CAMSAT are continuing their collaboration with the Qian Youth Aerospace Academy and have been able to get an amateur payload in the spacecraft.

There appears to be two CAS-2 satellites A1 and A2.

I worry where in 435 the downlink will be as the Russian Federation doesn't participate in International Frequency Coordination.

There are several Mode B linear transponder amateur radio sats scheduled for launch towards the end of 2012 and in 2013 that will have uplinks in 435 MHz so I'm hoping the MiR downlink will miss those.

Where did you find the reference to 435.3xx ?

It looks like they will be transmitting video from the satellite which implies a higher data rate and wider bandwidth on the downlink than previous satellites.

We had many discussions about this Russian satellites in this group.
I wrote many times this are intruders and I was shod as a Troll. But
I can repeat myself: Beware us for satellites from the Reshetnev
Company.

Actual active satellites are:

Mozhayets-4 on 435.3523 MHz with CW and DOKA-B in FM
Yubileiny on 435.3155 MHz - dito
Chibis-M on 435.3150 MHz with DOKA-B in FM

And there are more to come! The Reshetnev Company also found the
free amateur radio frequencies, not only the universities.

Two videos of the presentations that the Part-Time Scientist team gave to the Chaos Communication Camp can be seen on the AMSAT-UK website.

Not your Grandfathers moon landing
http://www.uk.amsat.org/?p=9258

The OSSI satellite due for launch in December has generated a vast amount of press publicity, last night I countered over 60 news outlets running the story two of which were UK national newspapers, see

http://www.uk.amsat.org/?p=9220

Due to the low orbit it'll only have a lifetime of 1 year. It's 145 up 435 band down but I'm unclear if it will permit two-way communications.

4604. 437 MHz - Curiosity - Mars Reconnaissance Orbiter Frequencies

Yahoo group: eu-amsat
Date: 2012-08-06 20:36:47 UTC
From: Trevor .
Topic: 4604 Message: 4604

My thanks to someone who emailed me earlier this evening.

Curiosity transmits around 401 MHz but the transponder on the Mars Reconnaissance Orbiter has a CCSDS Forward Frequency in the 437 MHz Amateur-Satellite Service band.

We well know that 435-438 MHz is shared with the Military but 432-438 MHz is of course a Space SAR Band and I understand General Space usage extends beyond that.

This paper describes the operation of the MRO (see page 34 onwards)

4605. Vermont Lunar Lander Ion Drive CubeSat aims for 2013 launch

Yahoo group: eu-amsat
Date: 2012-08-08 08:50:11 UTC
From: Trevor .
Topic: 4605 Message: 4605

This is just the technology we need for amateur radio communications CubeSats.

We don't need to go to the Moon but we do need to be able to get a CubeSat orbit in the 1250-2500 km range.

Watch the Vermont Ion Drive CubeSat presentation (skip first 7 minutes) at

http://www.uk.amsat.org/?p=9508

In Europe the Euroluna team (Team President OZ1HIA) has developed a 2U CubeSat with Ion drive for launch 2013 which aims to raise the orbit from 310 km to 700 km over the course of a year.

A CubeSat with fold out panels similar to that used on the Pegasus NEE-01 CubeSat could deliver enough power to support a 2-4 watt PEP output software defined linear transponder (SDX). You'd need that kind of power level on 145 MHz for 2500 km orbits given that the sat antenna will be a simple omni-directional.

4607. First Korean OSCAR

Yahoo group: eu-amsat
Date: 2012-08-09 12:24:59 UTC
From: Thomas Frey
Topic: 4607 Message: 4607

Hello All

There is an article about the first Korean OSCAR on Southgate AR News:
http://www.southgatearc.org/news/august2012/rsgb_books_used_by_korean_satellite_pioneer.htm

The first Korean OSCAR was KO-23, not KO-25, which was built in
collaboration and with support of SSTL in Guildford, Surrey England.
See http://www.amsat.org/amsat-new/satellites/satInfo.php?satID=47

Now, I don't know, if this books are used for the first KitSat-A or
for KitSat-B/KO-25.

Hi Domenico

I discuss the dismantling of my anf 5 other VE satellite amateur station in the past 3 weeks. (Incluging Clare VE3NPC that i meet last week
in Ottawa) They all come the the same conclusion NO HEO no more AMSAT NA members, and no more sustainable amateur satellite mass operators.

I don't know if i am still in the AMSAT-NA black list or cencorship list or called it anything else... but there is nothing more to expect
from this group aside of parroting news from other cube sats launch and grid chasing...

When i invest my money in the amateur satellite business i put my expenses in the liabilities column and the AMSAT membership fees in the
bad debt line under the same column but my unpaid years in the assets column.

P.S. If you don't see it in the AMSAT-NA bb you will know why...

73 and take care.

Domenico,

according to the following sentence:

"Furthermore we are very actively exploiting a potential shared ride of an amateur radio payload on a new geostationary satellite.
We have already submitted a formal project proposal.
The satellite will be visible from Europe. No antenna tracking will be necessary.
The big advantage of this project is that due to the operational requirements of the primary payload, our launching and commissioning is tied to the not too far future."

May I assume the satellite will be over China/Asia and won't be visible to us in South America?

I'm looking forward to hearing from you and our colleagues.

Dear OM's

I'm also very interested for the future of AMSAT-DL and its projects.
The Mars-mission P5A is cancelled now but NOT P3E. Please download
and view Peters presentation at www.batc.tv to have an impression.

I have to read my AMSAT-DL journal this weekend. If I find any
concrete mission, I will let you know it. After the meeting in
Bochum this year I hope there will be also some good news.

I'm quite confident Amsat-DL will achieve its goals, but would be quite helpful if someone could, at a proper time, let us know more details.
I've mentioned "proper time" as I'm aware launching business is quite expensive and further negotiations must be kept in secret for our own benefit.
Having said that, I'm willing to assist Amsat-DL as much as I can so to start using P3E.

I got the impression it was over Uganda in East Africa, no idea what the coverage will be but I'd guess about 60 degrees West would be the limit of coverage.

I'm at 32 South and 52 West as I write this message, and plan to be here for the years to come. If it weren't for my bad luck, I would have no luck at all.

Could you confirm that 60 West will be the edge, please?

No, it was just I got the impression from the presentation that the satellite would be over the Uganda, Kenya region but I could have misunderstood and it may be further East.

I doubt anything will be announced regarding coverage area until everything has been finalised which could be many months away. In his talk Peter said the issue of antennas still had to be resolved. I gather the positioning of the lowest frequency antenna on 2.4 GHz may present some challenges.

Adding the average age factor of the folks running the AMSAT-NA business at any level and the others involved they will not be there to
sustained this organization... Just look back the last 10 years it is always the same names we see at the AMSAT-NA BOD

Excerpt from Bob W7LRD

The amateur satellite community were the first to try lots of new launch
technology, and to bear the risk of those tests. Those technologies now
earn millions for the launch providers every year, but we don't earn a
cent and we certainly don't rate even the occasional free ride. We have
no friends in those launch providers. We have no friends in NASA,
apparently. We have no friends in government. We have nothing much,
really..

Any real business administrator will concluded that an organization in this present state and context can't survive. The others so called
administrator are offering their own solution eg:

"Then I guess we won't have to read any more complaining e-mail anymore"

"Sorry to say but after the first reading, you can suppose the e-mail
content from the subject, so you always have the "Canc" key; let people
expose their free opinions until their are in topic."

"I could not agree with you more John. But, I think I am seeing same folks griping
from at least 7 years ago. Maybe it is time for an AMSAT members only BB."

Now read below and draw your own conclusions some are showing up where their "Skills" came from.

Italy is often now described as Europe´s "too big to fail´' economy. The amount of its debt held by foreigners - nearly 800 billon euros -
is more than that of Greece, Ireland and Portugal combined. The debt problem is compounded by the country´s economic slowdown -
in December 2011, the government´s minister for economic development proclaimed that Italy

had already entered a recession.

As read elsewhere follow this link to know why there will be no more amateur radio satellite eg: HEO-MEO!

http://www.usdebtclock.org/

I repeat since so many years that HEO-MEO are the only way to go that i'm seeing more and more peoples starting to understand this very
simple issue. The amateur radio satellite field is dying at the same pace of his remaining LEO satellite.

Excuses, complaints, name calling, and so on will not change the crude reality, and if an organization who rely solely on a financial issue
to explain their inability to achieved their goals they should honestly start to manage their decay.

Again i refrain myself to point any individual i'm just looking at the facts. Time is confirming what i wrote in the past 10 years and it
is illogical to not see the unavoidable outcome but i understand the trend...http://www.usdebtclock.org/

P.S. Do you really think that "Maybe it is time for an AMSAT members only BB." will solved the censorship issue at AMSAT-NA? No...and for
those who rely on grid chasing and contest just look at this very instructive video made by K1OIK who speaks the truth about ham radio.
Contesters, "a proud and meaningless association of human beings"

Here is the link: http://www.youtube.com/watch?v=IWE7FrVY9T4&feature=related

I meet that guy last year in a Hamfest and we have some common opinions, i disagree on some but not all.

Again i'm only "quoting" him flame him not the messenger...BTW have a look at his other instructive video :) i like his "sense of humor"
eg: http://www.youtube.com/watch?v=dcuAnz0BmKA&feature=relmfu

Hello Nitin

Maik Hermenau reportet in the AMSAT-DL Forum all CubeSats are
released. Trevor published the frequencies several times, see
http://www.uk.amsat.org/?p=10119 . You can use Kepler data for the
ISS during the next days. Good luck.

Travel information

Driving directions

Googel maps

Data for GPS users: the IUZ (Observatory) has the geographic coordinates of 07° 11' 39 "East and 51° 25' 40" North.

In navigation systems, you can enter the address Blankensteiner road 147 in Bochum for the parking space. Please also use a navigation system read the following description to the parking.

Directions by car

First go to the motorway A 43 (Wuppertal Münster) and in the AK Bochum/Witten, exit Bochum traverses Castle (Ruhr-Universität, exit n ° 19) leave the A-43. It comes on the University Road and turn in this direction Bochum-Zentrum and Ruhr-University. The University leaves left and looks after about 3.5 km left in the median strip the tram station "Mark Str."

In this amount leaving the University Road to right on the exit "Mark Str." Below on the mark road you turn right direction Bochum-Linden/Weitmar.

Mark road in the left lane of straight off Linden/Weitmar Lane, if there are two straight arrows, and over 3 km straight ahead pass over several lights, always direction. In a town centre with shops we arrive then at an intersection, the left is a black skyscraper with many mobile radio antennas.

Also this junction the line crosses and follows the further course of the road, which now changes its name to "Henry-King-Straße". After 1 km there is right a large yellow sign: Linden straight Observatory left off. Unpaved accordingly at the crossing left into Blankensteiner Straße in direction Observatory (if you missed that post, comes at the next intersection at a lock sign.) (Where you should turn left and is again right). Now, in a Tempo-30-Zone and drives 1.4 km through a forest (watch out for joggers, Walkern, skaters, pedestrians, cyclists, horseback riders, radar guns).

At the end of the forest, the road is curvy, and you can see a sign there right to the restaurant "Waldesruh", there it goes right into the entrance and immediately left on the big square signposted as "public parking" and get off. Where the electrical low voltage overhead line at the car park runs, there is a walk in the back left corner towards IUZ, the venue. If get there through the bushes, you can see the direction South already the large dome of Radom. Follow the footpath on the playground over and reached the tarmac Obernbaakstraße 5 minutes away on foot. Follow it to the left to the entrance gate of IUZ (approx. 1 min) before the Radom. (Access to the IUZ to the Obernbaakstraße is different from the postal address!)

Note: The square directly in front of the Radom should be not parked to, because it is required for the logistics.

Directions by public transport

Bochum central station is by train (including ICE). There you move up at the bus station outside the main entrance in the bus of line 353 aiming at Bochum-Sundern (this destination specification must be front on the bus!).

The destination station to the IUZ called "Observatory", is a station before the terminus of the line. Going there on foot to the confluence with the Obernbaakstraße until you reach the entrance to the Radom. The buses after Sundern on Saturdays between one and three times per hour, depending on the time of day.

The fare is the journey time approx. 2 EUR, price level A. 30 minutes, caution: some buses only up to the Blankensteiner Street, and you would have to then do the above "jogging path" through the forest to the Observatory on foot (about 1/2 hour walk!). The return trip to the station is again with the bus line 353 toward "Castrop-rauxel Cathedral square".

Of course, there are also taxes in Bochum, Germany, for example, Tel. 0234-333 000 hotel accommodations abound for example at Bochum Hauptbahnhof.

From: Nitin Muttin
Topic: 4645 Message: 4645

FYI.

Ganesan , KJ6LRR (Awaiting his Indian HAM license) is part of the Technical committe of AMSAT INDIA and has designed and build engineering versions of a Linear Transponder and cubesat comm system which are currently being tested. Details are available in the below url of AI newsletters.

http://amsatindia.org/Newsletter/AMSATINDIA-News-April2011.pdf

http://amsatindia.org/Newsletter/AmsatIndia-News-May-09.pdf

He is also working on other projects related to amateur radio , more information available at his blog http://homebrewcorner.blogspot.in/ . I am sure he will comeup with interesting projects / products which will be of interest to Radio Hams for operations on Amateur Radio satellites.

Topic: 4652 Message: 4652

A report on KiwiSAT has been submitted to the IARU Region 3 conference taking place at the Kimdo-Royal City Hotel in Viet Nam.

The paper mentions a planned launch date of 3rd quarter 2013 "subject to financing".

The paper says: "Total costs to date is a mere NZ$39,000 which is a very minor amount compared with the $1,000,000 required to cover the launch costs."

Read the paper KiwiSAT - A Project of AMSAT-ZL at

Hello Simon and Trevor

I don't know what kind of plans this are. There is also a "plan" for
a moon mission - P5A-Moon. But nothing is concrete. I'm waiting for
the next printed Journal at beginning of December and hope for more
concrete news. I let you know it here.

Topic: 4657 Message: 4659

Hey Martin...My impression from other M2 antennas that I have used is that they are well built...as for an Eggbeater...I ran one for a bit (five years) in my Dodge Pickup truck (a Ram 1500) as my ISS/satellite antenna. It beat the heck out of my 2 meter vertical and I was "pretty" happy with how well it handled some of the trees on the streets that I drove in, although I did work pretty hard subconsciously to dodge the trees.

It came off my truck when the club I am with put a buoy together and we use the antenna on the buoy for APRS and data transmission...it does really well in this as its near the "MARS" rig in the Gulf ie about 300 miles offshore...and does pretty good. (and even though homemade has lasted some time...it is mostly composite)

They wont take the place of small yagis...even a three element CP Yagi in my view does better...but my experience is that a 2 element XP is about even. but you have to aim it..

From: OM0AAO Viliam
Topic: 4660 Message: 4660

Hi folks,

please watch carefully for the EIRP (power multiplied antenna gain minus coax losses).

Too much EIRP causes not only problems to the other stations on the bird but also could damage battery on the sat.

If your signal is good readable and suddenly changes to distorted and weak, there is other signal on the transponder that takes too much current from solar cells/battery.

This is usually symptom on the AO-7 but now starting on the VO-52. Did not understand why you must be S9+. S7 not enoungh to make contact?

You think - what is he talking about? S9+? My meter showing max. S3 and some signals are not audible?

Remember that directional antenna with AZ/EL rotor and low-loss preamp make great change!

My RX setup on 2m:

5el.vertically polarized DK7ZB http://www.qsl.net/dk7zb/
HA8ET ATF-51389 preamp http://www.ha8et.hu/
AZ/EL rotor with DF9GR interface http://easy-rotor-control.com/
home made XVRT 2m/10m
President Lincoln with IF 10,7MHz out mod
Softrock Ensemble http://www.wb5rvz.com/sdr/ensemble/
E-MU 0202
PowerSDR 2.44 with http://code.google.com/p/powersdr-iq/downloads/list

Please pay attention to improve RX - it is cheaper than power amplifier, no TVI, better hearing = more fun!

4675. Sirius satellites beacons +/- 2320.190 MHz ?

Yahoo group: eu-amsat
Date: 2012-12-04 16:04:38 UTC
From: f6htj
Topic: 4675 Message: 4675

Hello all; for information I was told by Piero
I5CTE there is permanent continuous carrier beacon around 2320.190 MHz (+/- doppler)
coming from 1 of the 3 Sirius elliptic NA satellites.
It appears reception is very good here with small 20 turn helix
antenna (in spite of 12m heliax coax) peaking 539.
Apogee (50000km) around 325deg with 27deg elevation.
F5BOF reports same signal with small hand held 25 elements f9ft yagi.

So these are for us very interesting beacons. Depending hours we can receive 1 o 2 sats.
Real time positions (Sirius-1 / Sirius-2 / Sirius-3) here:
http://www.n2yo.com/satellites/?c=33
Any info about beacon sat polarisation and eirp ?

4680. Re: GERMAN SPACE AGENCY REJECTS AMSAT DL

Yahoo group: eu-amsat
Date: 2012-11-14 21:55:06 UTC
From: hpaesler01
Topic: 4654 Message: 4680

I sent this message approx. 2 hours ago but it seems as if it didn't get through. So this is the second try.

Dear group,

to avoid Chinese Whispers:

AMSAT-DL never planned a GEO satellite in the past and does not at present. The reasons were already discussed in length. However, there were serious negotiations for kind of piggy-pack on a commercial GEO satellite. For technical reasons (for example due to antenna restrictions it would have a microwave spot beam that covers only an area equivalent to one half of Germany plus massive of other technical challenges) chances are not too good.

About a AMSAT-DL moon mission I have to go a bit more into detail: In 2009 we did a Concurrent Engineering study in collaboration with DLR Bremen to prove the technical feasibility of a P5-A mars mission. DLR would provide scientific payloads and other help. Since a suitable launch window to Mars is not before 2018, DLR suggested an interim mission (~2014) to Moon to prepare for the Mars mission. It had some really nice payloads.

So we first did the study of a Moon mission and then for a Mars mission. It was proven and documented that both missions are technically feasible using the "AMSAT approach". Collaboration between the DLR Bremen people and AMSAT-DL was excellent.

We even, especially because DLR management asked to do so, focused on the Moon mission first when we met with german government representatives and the chief executive of DLR Germany. It quickly turned out that the government is not so interested in a Moon mission and another meeting with strong emphasis on Mars was held some weeks later. That was in November/December 2011.

The rest is more or less as you read in the news item. I suspect there was a slight misunderstanding in the definitions between a GEO (geostationary) satellite and a GTO (which is only a temporary transfer orbit) which is needed to put a P3 satellite into HEO. Hopefully, this message clarified things.

73,

Hartmut DL1YDD
AMSAT-DL VP

4686. Thanks for your support

Yahoo group: eu-amsat
Date: 2012-12-22 19:03:22 UTC
From: allan_gm1sxx
Topic: 4686 Message: 4686

Hi.

This group has been running for about 8 years and has averaged around 180-200 members. Unfortunately Makis SV1BSX who originally set up the group passed away several years ago. John LA2QAA who was one of the other group moderators lost interest in AMSAT many years ago, leaving myself as the sole moderator. I contacted John recently, but when he left the group, he'd 'binned' all references to this group years ago, so can't take over again as Moderator. Like myself, John now pursues new interests.

I lost interest in AMSAT many years ago when 'they got into bed' with the education sector and shifted their focus to FM birds and CUBESATs. I haven't the slightest interest in any of these birds.

As of several years ago, since Makis passed away, I am now the only remaining moderator, but unfortunately for me, I can't do what I wish and promote anyone else in the group to moderator status, before I bow out of the group. I would have liked to have asked Mike DK3WN to be the group moderator, but I can't. This is because of the way Makis set up the original group with him as group owner and John and I as Group Moderators with somewhat more limited privileges. In short, I can't elevate anyone else to Moderator.

For myself, my interests in amateur radio are stronger than ever (I was licensed in 1986) but I haven't the slightest interest in AMSAT any more. As far as I'm concerned, they threw the baby out with the bath-water many years ago. It's now a very different organisation from the one I joined, and had such great pride in.

Could I please respectfully suggest that someone from the group sets up a new EU-AMSAT group, perhaps maybe EU-AMSAT-NEW and invite the members of this group to join it, since there is still an obvious interest in promoting a European Amateur Satellite group on Yahoo.
Mike? Anyone?

Thank you all for your support for this group over the years. By any measure, it was a success, for what at the start was a small splinter group free of AMSAT BB 'rules'. I believe that was a major contribution to its success.

Hopefully a new group can be created.... but just watch those Yahoo Moderator rules :-)

Wishing you all a Merry Christmas and a Happy New Year when they arrive.

The EU-AMSAT group will stay live for the foreseeable future, But I urge group members to use the EU-AMSAT group to elect Moderators and create a new Yahoo group that the members of this group may 'migrate' to. As of now, I won't be around to approve new members and suchlike.

Finally, Makis left an excellent legacy to ham radio operators in the form of projects and info. You can see more at...

http://www.qsl.net/sv1bsx/homebrew.html

It's worth a look.

4690. A replacement group.

Yahoo group: eu-amsat
Date: 2012-12-23 10:12:48 UTC
From: allan_gm1sxx
Topic: 4690 Message: 4690

Hi Folks.

Because of the problems encountered with managing this group, I'm working on a direct replacement for it which will resolve the problems I'm having with this group.

The members of this group will all receive an invite to join the new group, but this process will take a few days because of the way that YAHOO Groups operate.

Yahoo limits the number of invites that are allowed daily.
You can be assured that everyone who uses this group will receive an invite to the new group over the holiday period.

The new group will have the same 'look and feel' as the old one and you should only really notice a slight change of name, to EU_AMSAT rather than the current name (EU-AMSAT).

When the work of transferring members across is complete, I'll 'freeze' the old group but leave it in place for reference only.

This is the best fix for the problems I've been encountering and should ensure that the group can continue to operate into the future.

At that point, I'll bow out and pass control to new moderators.

Kind Regards,
Allan Copland

Thanks Simon.

Other readers should note that the new group is available and that future postings should be to there. The address is ...
http://uk.groups.yahoo.com/group/EU_AMSAT/

We've signed Simon and a few others over to the new group. Anyone else who posts a request will also be approved as soon as we can manage.

Regards,
Group Moderator

IMPORTANT

Please post to the new group in future.
Messages posted to this group in future will be deleted.

http://uk.groups.yahoo.com/group/eu_amsat/

Most members of the old group should already have received invites to transfer to the new group. Only a few members still have to be sent out invites, so *now* is the time to transfer to the new group.

From: David Johnson
Topic: 4703 Message: 4703

This was originally HamsatDroid. The name has been changed so that it better suits it's role as a fund raiser for AMSAT worlwide. The current version is free but there will be a paid version in the very near future with more features.

How are you doing? This has had to come in a hurry and it has left me in a devastating state. i traveled to the imperial college,Maritime Medical Center,
Swansea Wales) to see my cousin who is critically ill.He is been diagnosed with (Acute Lymphoblastic Leukemia). I was advised that the only way he can survive is by undergoing a BMT (Bone Marrow Transplant)

Please I really need your assistance as this is a matter of life and death.I hope you get back to me as soon as you get this mail

Thanks and Regards,

Iain

4706. SATPC32 locks with IC-7000

Yahoo group: eu-amsat
Date: 2013-12-15 17:37:04 UTC
From: <ea6vq_ml@...>
Topic: 4706 Message: 4706

I have just got the CAT cable for my IC-7000. I have configured CAT connection in SATPC32 V 12.8b DEMO and it initially works (I see frequency changin in the rig), but after some time the programs locks and I have to kill it from windows task-manager. This happens sometimes when I change from one satellite to another or when I manually change the frequency using the rig's dial.

Any idea of what can be wrong?

Thanks

I'm not a SatPC32 user but it looks like a data overflow on the
serial port.
